Perhaps, as a general rule, the new Dahlias of any particular year are not shown in so good a state as when exhibited as seedlings the previous year. The result will almost always occur, in a greater or less degree, though there are always exceptions. The reason for this was well put by the late Mr. John Sladden some years ago. He said, "When a seedling is to be put upon its trial it enjoys peculiar advantages. Being then, for the most part, in the hands of the raiser, it experiences, so to speak, a kind of parental care or solicitude: from the earliest period of its existence to the time it is 'brought up for judgment,' it is watched and tended with the utmost anxiety; every appliance of Art and Nature is summoned to its aid; and when, at length, it is produced before the world, it follows, as a matter of course, that it comes forth in the highest state of perfection to which it is capable of being raised. Now let us note the career of such a production. Week after week it is exhibited, three or six blooms, as the case may be, and always in excellent condition. Such a gem cannot escape observation: every grower looks upon it as a great acquisition—sees, in imagination, its splendid appearance in his stands for the ensuing year, and orders it accordingly. The stock, it may be, is limited, while the plants re-

quired are very numerous, and what, now, is the fate of this pet—this spoiled child, which has been reared in the lap of luxury? Alas! it becomes the victim of over-popularity. The demand is great, and the supply must be made to keep pace with it, be it ever so enormous. Our unfortunate subject is therefore forced and driven to, and almost beyond, its utmost powers of endurance; for every bud it produces must, if possible, be converted into a distinct independent being, having a perfect organisation of its own, and complete in all its parts. In due time a plant thus artificially reared comes into the possession of the grower, who, instead of nursing it tenderly, is often anxious to make the most of it in another sense, and who, under the erroneous impression that he will have a better chance of blooms from two or three plants than from one, still further mutilates and multiplies it, unthinking that he is deteriorating the quality in the exact ratio that he increases the quantity of his new acquisition. What marvel, then, that under such unnatural treatment the constitution of the variety should become seriously impaired? It may retain indeed the principles of simple vitality, it may grow freely, and be apparently healthy and vigorous, and yet its powers of reproduction may have suffered to such an extent as to render it incapable of yielding perfect blooms until time and less severe discipline shall have restored it to its pristine state, and a year or even more may elapse before this restoration is complete." *R. D.*

## Garden Operations.

### FLOWER GARDEN, ETC.

The long-continued wintry weather having hitherto hindered the performance of all new or extra work, that only that really must be done should now be carried out, as under no circumstances should such work be allowed to interfere or interrupt the usual routine labours which an advancing season always brings. Perfection of keeping, by which is meant general neatness and order, is only attainable by doing everything at the proper time; therefore, let all extra labours be at once brought to a close. Of course, if additional hands are allowed extra work can still be done, but unfortunately gardeners are supposed by some employers never to require additional assistance. In frosty weather all strength should be concentrated on clipping and trimming hedges, cutting Laurels, Hollies, and other shrubs, and the more straggling shoots of Rhododendrons, and the removal of the old seed-pods from such as through lack of time were not done as soon as the flowering season was over; and this, together with wheeling or carting of manure or soil, as the case may be, will afford profitable employment till a change occurs, and then all tree and shrub planting still on hand should have first attention, that they may get established in the soil before there is danger of their being checked by drought. When practicable a mulching of stable litter should be given.

A change to milder weather will start spring-flowering plants into active growth, and when this has taken place they are more susceptible of injury at each recurring frost, hence the necessity of affording the tenderer kinds some slight protection by evergreen boughs, or tiffany supported by hooped sticks, and the ends of it pegged into the turf. After each sharp frost all the beds should be gone over and the plants well firmed in the soil. A mulching of cocoa-fibre refuse is a good preventive of such upheaving by frost, and at the same time gives a neat appearance to the beds. The season for division, re-arrangement, or for making new plantations of hardy herbaceous and other perennial plants is at hand; the following are showy, lasting, and easy of culture:—*Antirrhinums*, *Anemones*, *Aquilegias*, *Delphiniums*, *Dianthus*, *Funkias*, *Helianthus*, *Irises*, *Liliums*, *Myosotis*, *Pentstemons*, *Pæonies*, *Phloxes*, *Pyrethrums*, *Spiræas*, and *Tritomas*. Where such plants are grown in borders entirely devoted to them a knowledge of their height and habit of growth is necessary, in order to assign the rightful position to each; but when grown in rockery gardens, in odd nooks and corners, or in front of shrubby clumps, the arrangement is not of so much importance.

I have long had in my mind's eye—but hitherto no opportunity of working it out—the *beau idéal* of an herbaceous border. It is as follows:—Plants arranged in lines and distances according to height and spread of growth—fine-foliaged and variegated kinds to alternate with the free-flowering kinds; spring and autumn flowering kinds also to alternate, or, at least, to be so intermixed that at all seasons there should be an even balance of flowers throughout the arrangement: the interstices between each plant, or line of plants, should be filled with bulbs—*Crocuses*, *Daffodils*, *Snowdrops*, *Scillas*, *Liliums*, *Gladioli*, &c.; whilst the whole groundwork of the border should be covered with

surface-rooting Sedums of various colours. I hope ere long to be privileged so to arrange such a border; for, the year round, there would always be in it something of beauty and interest. Anemones, Ranunculuses, and Gladioli ought to be planted as soon as the frost is out of the ground, for early planting prevents the exhaustion and consequent deterioration of flowers which takes place when growth is developed prior to planting the bulbs; and if through any circumstance they cannot yet be planted, keep them, to hinder growth, in as cool a place as possible. In preparing beds for these the soil should be deep, and if of an adhesive nature there should be a liberal admixture of leaf-mould and plenty of drainage; for a light soil a good allowance of cow-manure is necessary to obtain fine flowers. Sweet Peas are always welcome flowers, and it will now be safe to sow these in the open ground. Though I have occasionally sown them in pots, and raised them in warmth, and transferred them to the open ground as the weather became mild, the gain was so little that I would not commend the practice.

Summer bedding arrangements ought now to be completed, that due time may be afforded for the propagation of the necessary plants; and to those who have hitherto mainly depended on Pelargoniums, Lobelias, Calceolarias, and plants of similar nature, I would say, make an effort to get out of this rut, not by entirely excluding these, but toning down the necessarily high colouring which such plants produce by using others of more sombre hues, and particularly aiming to work in as many hardy plants as possible. Thus, whilst ensuring permanency of effect, there will be less work to be done in the propagation of tender plants. *W. Wildsmith, Heckfeld.*

#### HARDY FRUIT GARDEN.

With the unsettled state of the weather, which as I write inclines to a thaw, one can hardly speculate upon what the morrow may bring forth. The fact, however, remains, that ground operations, as far as the planting of fruit trees is concerned, has been suspended for nearly three months, and that all these arrears of work, together with minor routine duties, are now claiming prior attention to more seasonable work. The thinning and pruning of overgrown orchard trees, such as Apples, Pears, Plums, Cherries, and Damsons, has come in for more than a usual share of attention, owing to the protracted severity of the frost, and although the benefit to the trees may not be perceptible during the present season, the operation, if skillfully performed, will be sure to exercise a beneficial influence on future crops. Where wall trees are advanced in years and thinning out was included in the prospective programme of last autumn, the idea of prosecuting the work with much hope of success had better be abandoned until next winter. Young trees may yet be lifted, in order to fill up blank spaces on walls which are unsightly, as well as being unprofitable. The loss or gain of a season's growth is oftentimes of vital importance to the gardener, and as fruit trees generally cannot be expected to yield heavy crops this season, an effort should be made to have them established at the root, thereby giving greater security of a crop next year. With a view of facilitating this kind of work, the pits should be got in readiness for the reception of the trees, so that there may be no delay in pushing forward the work when the weather is propitious. Our pits are made 2 yards long, and from 3 to 4 feet wide, and 3 feet deep; in wet, tenacious soils, 2 feet 6 inches would be deep enough. I think the latter depth would be sufficient in any locality in a north aspect, where evaporation takes place slowly in consequence of the situation being shielded from the action of the sun.

The pits should be bricked round, and drainage provided according to the general conditions of soil and climate. The trees should also be carefully mulched with litter, and their branches will only require to be roughly tacked up for the present.

The pruning, tying, and nailing of wall trees has come within the category of possibilities for a few hours each day lately, and the cleaning and washing of the walls which should have taken place previously in order to dislodge insect pests, will have to succeed, instead of precede, the work of training. I do not know that the labour generally allowed in gardens will admit of more being done in this way than to give the walls a good scouring with soapsuds, applying it with force by means of a garden-engine, and I do not know that a more tedious, if more expensive, process would be more likely to eradicate the foe more efficiently.

Bullfinches have already put in appearance with us, and a careful eye will have to be kept upon them. They will attack the most forward fruit-buds, and denude a whole tree of every blossom if not detected in time. The pruning of bush and other fruits will have to be pressed forward with energy during the present month, and material for protecting wall and other fruit trees had better be seen to some time before it is required. *W. Hinds, Canford Manor.*

#### FRUIT HOUSES.

PEACHES AND NECTARINES.—If any of the late kinds of Peaches in the early house are still in flower, the ventilators opposite the trees must be kept sufficiently open to admit of a circulation of air without producing a draught, and unless they are known to be sure setters the favourite mode of fertilisation may be followed up. When all the fruit is set, syringing once or twice a day with tepid water will be necessary for cleansing the trees of the remains of the blossoms and keeping insects in check until it is considered safe to fumigate the house. This stage having been reached all exhausted fermenting material may be removed from inside borders, and if the latter are in a fit state for watering advantage should be taken of a fine morning for giving a moderate supply of tepid liquid to old trees that show signs of weakness, and water without the stimulant to young ones which seldom exhaust themselves by carrying a profusion of flowers. Under generous treatment, with due attention to moisture and early closing, the young shoots will now grow very fast, and require daily attention to disbudbing, the little and often principle being the best. By commencing at the extremities of the trees and taking the foreright shoots first a check to the flow of sap will be avoided, and the weakest and least forward parts will gain strength, which may be still further increased by pinching out some of the points of the side shoots on the strongest branches at subsequent disbuddings. In early houses those closely stopped shoots form spurs which invariably ripen well and set plenty of fruit the following year, but the system is not so applicable to late ones, as they do not swell off such large Peaches as shoots that are laid in from the lower part of the bearing wood of the current season. The trees in succession-houses will now be swelling their buds very fast. With us they give promise of an abundance of very fine flowers, which will be thinned on the under sides of the shoots before they open. The inside borders have been well watered this week and lightly mulched with short litter as a means of protection to the surface-roots, and the house will be fumigated when the blossoms begin to show their charming tints of colour. In days gone by it has been usual to advise the retarding of cold houses as a means of escaping spring frosts. This may still receive attention where the latest Peaches are grown under glass, but we hope the lesson of the past two years will have led the owners of all cold houses to take advantage of the low price of hot-water pipes, and that Jack Frost may now be met by a counterblast that will deprive him of his power to destroy in a single night that which has cost the anxious attendant the work of a year. *W. Coleman, Eastnor.*

#### MELONS.

With an increase of light and occasional blinks of sunshine these are making a nice growth, and to encourage a quick, but at the same time a sturdy growth, every available means must now be employed. To achieve this, let us assume that the cultivator has sufficient top and bottom-heat at command, and by ventilating on all favourable occasions, and shutting up early with genial atmospheric moisture on bright days, a quick, sturdy, and consolidated growth will be the result, which with the Melon, as other plants, is the foundation of success; and when the after-treatment is consistent with the requirements of the plants satisfactory returns will invariably be the result. Great care, however, must be exercised in not admitting an unbroken current of air while the wind remains in the north and north-east quarters in which it has been stereotyped for some considerable time past. A piece of hexagon netting, doubled a couple of times, and placed over or under the ventilators, as the case may be, will answer this purpose. Cover dung frames with double mats and plenty of fern at night, and see that the linings are regularly attended to—that is to say, that the old linings are removed and replaced by fresh fermenting material. Maintain a top and bottom temperature as previously recommended. Sow little and often for succession and other purposes, as it is always well to have a few plants more than one wants. *W. Ward, Longford Castle.*

#### CUCUMBERS.

Maintain a night temperature of from 65° to 70°, and from 80° to 90° with sun, and put a little air on on all favourable occasions, shutting up early in the afternoon, with plenty of atmospheric moisture on bright sunny days. This, with a judicious application of tepid liquid-manure to the roots, will cause the plants to make a free growth. Crop lightly and keep the plants clean. Young plants will now be ready for transferring to the hillocks in the Cucumber-house—assuming that the said house has been thoroughly cleansed, and that the soil has been in it a few days previous to planting, that it may become warm. The soil having been pressed firmly around each plant, a stick should be put to each, and fastened to the first wire of the trellis; and should there be bright sunshine at the time of planting a light shading should be applied for a couple of hours, from 11

to 1 o'clock, for a few days, to prevent their flagging, after which it can be discontinued and the plants subjected to the full influence of the sun's rays. See that the linings of dung frames in which Cucumbers are growing are made up weekly or fortnightly, according to the state of the weather and the fermenting material existing at the time; and to meet this and other demands keep a good supply of well mixed dung and leaves in readiness in the reserve yard. *W. Ward, Longford Castle.*

#### PLANT HOUSES.

CONSERVATORIES.—With the many forced things that are now fast coming in, and others that are flowering naturally, these structures may be made gay and interesting, but to impart the latter desirable feature it is necessary to vary the arrangement occasionally, and to introduce plants of bold type or such as are admired for the beauty of their foliage. None commend themselves more in this latter respect than small Palms and Ferns, either of which not only impart a more ripened and finished appearance to any house, but help to tone down the colour and give character to the whole, especially if judiciously interspersed so as to maintain the right balance. To crowd a place with only such as are in bloom—to think of producing the best effect in that way—is a great mistake, as, although Nature provides most plants with ample leafage to set off their blossoms, she distributes others amongst them in such a manner that there is always beauty of form and plenty of greenery for the eye to rest on.

Camellias being now in a very advanced stage, soot-water or other liquid manure will be of great assistance in helping the flowers to expand, but whichever is used it is of the greatest importance that it be perfectly clear, as otherwise it stops up the pores of the soil and keeps out the air, so important to the welfare of the roots. On no account should these be allowed to become dry at this season, as when they do the plants suffer immediately, so great is the demand now made on them. It is not the frequent slopping that is wanted—this is more to be guarded against, but a thorough soaking should be given, and then none till the soil is in a fit condition to receive the same again, in which way it may be kept sweet and wholesome for the fibrous rootlets to feed on. Where roof climbers have become worn out or exhausted, the present is a good time to set about their renovation or renewal, which may be done in the former case by removing a good portion of the border and substituting for the part taken away an equal bulk of fresh fibry loam and peat—a mixture that most conservatory climbers delight in. When borders are newly made, these ingredients cannot well be used too rough, and to keep them porous for a long period sharp sand is of great service, as also a few bushels of finely-broken charcoal and bones, both of which add materially to the health of the plants. Good and proper drainage is the first consideration, and this may be provided by 6 inches or so of soft red brickbats, and to keep the interstices of these open it is a good plan to cover them with thin-cut turves previous to putting in the soil already prepared. Those who would grow the *Lapageria* well should use nothing but peat in large sods, with sand sprinkled between; by doing which the fleshy roots have full liberty to ramify, and the water required in such abundance will meet with no obstruction in its passage, and can pass freely off. Without such a provision being made, peat soon becomes a sodden, inert mass.

#### STOVES.

A busy season is now before the cultivator in these, as not only is there much potting to be done, but there is the work of propagation to be carried on in order to get up a stock of such things as flower next winter—*Euphorbia jacquiniiflora*, *Sericographis Ghiesbreghtiana*, *Thrysaenthus rutilans*, *Justicia flavicomis*, *Plumbago rosea*, and *Centropogon Lucyanus*. When it is intended to keep old plants of any of these, no time should be lost, after they have done blooming, in cutting them back, that they may break again as quickly as possible, as, in a general way, they get rest enough when in bloom by being kept in cool houses. Till they make a fresh start, moderate dryness at the root is essential, as otherwise they bleed, and do not push so strongly as they would. Before any re-potting commences, it is always advisable to go through the whole stock of plants, and give them a thorough cleaning, that when they get into their new soil they may at once be stood away to grow without any further interference or disturbance; and not only this, but they may be handled more readily and safely now than when the young foliage is in a more advanced stage. Roof climbers that grow overhead will require special attention to free them from insects, one of the worst of which—mealy-bug—the *Stephanotis* is particularly liable to, and the leaves being of such thick texture, they will fortunately stand a fierce squirting of water, which is the best way of dealing with these pests when their ambition leads them to such exalted positions. *F. Sheppard.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb. 9	{ Sale of Filices, Tuberoses, Tigridias, &c., at Stevens' Rooms.
		{ Sale of Filices, Orchids, &c., at The Mart, by Protheroe & Morris.
TUESDAY,	Feb. 10	{ Royal Horticultural Society: Meeting of Fruit and Floral Committees at 11 A.M., Scientific Committee at 4 P.M., Annual General Meeting at 7 P.M.
WEDNESDAY,	Feb. 11	{ Sale of Roses, Fruit Trees, &c., at Stevens' Rooms.
THURSDAY,	Feb. 12	{ Sale of Orchids, at Stevens' Rooms.
FRIDAY,	Feb. 14	{ Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

THERE is some danger that the worn and threadbare simile of the "cool Parsley bed" is to be revived. A new crusade seems about to be preached against ART IN OUR FLOWER GARDENS, as seen in what is called bedding out. Last summer a Parsley bed was cold enough to have frozen the beholder, whilst bits of colour were scarce and sadly wanting. The blaze of hue was nowhere too warm, bloom and colour were sighed for, but, alas! in vain; the old simile lost all its force, and its power to ridicule is, if not gone for ever, at least considerably toned down. After what we have gone through it will be long ere any effort will succeed in overthrowing the taste for summer gardening, and for masses and combinations of floral colours.

From the foundation of art there have been in all its varied branches schools of thought as diverse as possible. Architecture, sculpture, painting, music—all have found in their devotees thoughts and ideas entirely dissimilar; and between these schools there have waged wars of the bitterest kinds. Looking back from our modern and advanced standpoint, we are disposed to laugh at these mediæval quarrels, and willingly concede to each school its right to think as it likes. We have need to employ some of this charity when we take sides in some modern art controversy, even though it be upon such a simple and unpretentious topic as Art in our flower gardens. The first thing to be admitted is the undoubted right of every one to do as he likes in his own garden. Any rule of rigid dealing would but land us in the misery of utter monotony. The diversity of ideas and tastes give us diversity in garden aspects, and although there may be many gardens below mediocrity, yet no two are exactly the same, even though the tendency to imitate is perhaps as great amongst gardeners as it is in any portion of the community.

There can be no fixed rules of art in gardening simply because gardening, and flower gardening specially so, is a matter of taste. That taste may be vulgar, or it may be most refined. To one parterre bedding is an abomination, to another it is the elegance of a seventh heaven. It is all a question of taste and of tolerance.

A garden often reflects the tastes and predilections of its owner. If one visit a garden and see nothing but gaudy flower-beds, without a particle of interest in them beyond a blaze of colour, the effect produced is just similar to what would be felt on entering a library and finding it stocked with green and yellow paper-covered books of the railway-stall order of literature. So, if one enters a garden where close under the drawing-room windows there are huge oval or circular beds with a straggling *Arbor-vitæ* in the centre, some cachectic Roses and superannuated herbaceous plants around it, one is apt to be reminded of an old-clothes shop.

Good taste by itself is not enough—a flower-bed may be unexceptional, a herbaceous border full from February to November with gems and

plants as superior in interest to the meaningless gauds of the parterre as the coats of armour in the old hall are to the tinsel and pasteboard of the stage, and yet they may be made unsuitable or out of place. The beauty of appropriateness takes precedence. A well designed flower-bed is most appropriate near the house in association with architectural features. Herbaceous borders as a rule suffer from too close approximation to the dressed garden, and even shrubby borders are best at a little distance from the house. Wilderness walks and wild gardens generally are best quite away from the house, although some of their admirers would displace the flower-beds to substitute the freer and admittedly more interesting plants. With all our love for the natural style of gardening, we think this would be a great mistake. The ideal garden should contain a little of everything that is good, but that little should be disposed in the right places.

In the planning and planting of floral parterres the art-feeling of the operator is brought strongly into play, first, in the arrangement and sketching of pleasing designs; second, in the harmonious combinations of colours. In both these matters rules may be laid down, but training and taste after all are the best guides, because the object and purpose of a decorative garden is to please and gratify those for whom it is fashioned. That the best abilities and highest art evolutions will afford the widest gratification there can be little doubt. The beds produced by the floral artist must inevitably carry away the palm from mere "hearth-rug" patterns and designs, but even these will find plenty of admirers. There is no antagonism in the one floral art school as embodied in the lovers of parterre bedding: there may be divergences as to results, as obtained by different artists, but on the main point—as to the desirability and beauty of the system—there is none. The antagonistic school are the garden pre-Raphaelites, the "natural" worshippers—men who are inconsistent enough to fall into ecstasies over a painted window, showing in unusual brilliance all the colours of the rainbow, and to preach a *jeûne* against rich combinations of colour in flower gardens. To these the *beau idéal* of a garden is found in trees, rockwork, masses of shrubs, green grass, borders and beds of heterogeneous plants of all kinds, sizes, and characters, and perhaps a wild or weed garden. There is just a dash of Whistleism about them, and they favour Golden-rod amidst a mass of Laurel, of a purple Clematis amongst a ground of Ivy as nocturnes of green and gold or green and purple rich in perfection and artistic beauty.

Differ as widely as we may in discussing this matter, we come back inevitably to the starting point, that it is a matter of taste, and that no rules can be laid down which shall say what should and what should not be. We may even take the matter out of the region of art into that commonplace one of trade, and say that here the bedding-out system has its advantages. It causes work, it promotes trade, as thousands of garden labourers and florists can testify. That it does involve considerable labour there can be little doubt, but so also must any garden work, even to the most simple feature, if it is to be done well. Then parterre flower gardening is more a taste of the wealthy than of the poor, and the wealthy might do worse than spend their riches in the promotion of their own fancies in flower gardening. Even in humble circles, however, where the love for a good show of summer flowers prevails, the disposition to spend any spare cash is well directed where a love for gardening and bedding-out predominates. The frequent changes incidental to floral bedding also promotes additional interest in garden work.

The changes from spring hues of softness and beauty to summer colours rich and glowing, that gradually soften off and fade into the cold dull hues of winter, when even a silver or golden leaf is treasured as a flower, are all full of deep interest and promote excitement. These are charms that "natural" gardening yields not in like degree, and which its votaries, happy in their ignorance, are unable to appreciate. Nature now and then throws together for our delectation some magnificent masses of colour. A common of Gorse all aglow with golden bloom, a field of scarlet Poppies like a crimson sea, huge waving masses of Bluebells—all excite our admiration and delight. What Nature here does the flower gardener with art seeks to emulate in his parterres: the scarlets, the yellows, and blues, subdued and combined with softer tints, create a spectacle of beauty. As we shiver in the cold blasts of winter we mentally ejaculate, "May we soon gaze upon the like again and again."

— A BROOK-SIDE VIEW.—In the midst of fogs of Stygian blackness it is pleasant to be reminded of other sights than smoke, vapour, and rime. Mr. FITCH'S drawing of a brook-side view carries us in retrospect and in anticipation to the flowery mid-summer tide, and it furnishes a hint to gardeners and others in their treatment of water and its adjuncts. It is astonishing how little use is made of our native Water Lilies, our *Lythrums* and *Lysimachias*—how we pass over the *Persicaria*, the Yellow Flag, the flowering reed, the Buckbean, the *Villarsia*, and a host of hardy aquatics, indigenous and exotic, which are not surpassed in beauty or interest by any class of plants.

— THE INTERNATIONAL POTATO EXHIBITION.—A meeting of the committee established for carrying out the International Potato Exhibition was held at the Masonic Club, 101, Queen Victoria Street, E.C., on Friday, January 30. The financial statement brought before the meeting was very satisfactory, there being a balance in hand of £23 7s. 2d. It was decided to hold the exhibition for this year at the Crystal Palace, Sydenham, on September 22 and 23. The Lord Mayor, Sir FRANCIS WYATT TRUSCOTT, has kindly consented to accept the office of President for this year, and in all probability will proceed to the Crystal Palace in state to open the exhibition on Wednesday, September 22. The schedule of prizes has been slightly enlarged, 5th prizes being added in Classes C and D, and 4th prizes in E and F.

— FARMERS AND THE INCOME TAX.—Sir CHAS. W. STRICKLAND writes:—"I see that you quote in your last number the decision of the Board of Inland Revenue, that they would only make an allowance in income-tax on a return of rent when it was made in the form least beneficial both to the landlord and tenant. Of course no one who is acquainted with the character of Government officials, especially of those connected with the office of Inland Revenue, can be surprised at so unjust and senseless a decision, but it seems to me to be carrying the natural oppressiveness of the tax collector rather far to charge those landlords who take the greatest interest in their property, income-tax upon income which they do not receive, when it is not charged upon others."

— ART IN THE CONSERVATORY.—We omitted to state that the series of designs exhibited at the Leeds Architectural Society by Mr. MAURICE ADAMS, and one of which was reproduced in our columns a short time since, form part of a work prepared for Messrs. MESSENGER, of Loughborough, and on the eve of publication, entitled *Artistic Conservatories*.

— EXTENSIVE PLANTING IN SCOTLAND.—The *Journal of Forestry* states that on the estate of Mr. YOUNG, Durris, Kincardineshire, upwards of four-and-a-half millions of young forest trees have been planted within the last three years. The area occupied by this immense number of plants amounts to about 1400 acres, and the sorts planted consist of Scots Fir, Larch, *Abies Douglasii*, Silver Fir, and Spruce.

— THE NEW FOREST. — The important appointment of Deputy-Surveyor of the New Forest has been conferred upon a son of the Earl of HAREWOOD, the Hon. GERARD LASCELLES.

— DEATH OF MR. M'COMBIE, OF TILLYFOUR. — Mr. M'COMBIE, of Tillyfour, the distinguished agriculturist and late Member of Parliament for the Western Division of Aberdeenshire, died on Sunday evening last, at his residence at Tillyfour, Aberdeenshire, in his 75th year. He had a remarkably successful career as an agriculturist, more especially as a breeder and feeder of cattle; and was the author of a book entitled *Cattle and Cattle Breeders*, which has reached a third edition. He was also the

Pinsapo, A. Nordmanniana, Wellingtonia, Thuja gigantea, and all the orientalis tribe — all the Rhododendrons and all the evergreen plants, with the exception of Buxus, are killed down to the snow line. Only the small plants which were covered by snow have escaped. There is not one standard Rose left—even the Dog Rose stocks in the woods are dead." This is a terrible picture, and needs no comment; but it may tend to assuage the concern of English nurserymen for the comparatively small losses sustained in this country.

— SIR CHARLES W. STRICKLAND, BART. — We understand that, in consequence of Mr. BEAUMONT, who was nominated High Sheriff of Yorkshire

the average total value of the Potato crop in Ireland at £9,250,000, and the loss sustained by the failure of last year's crop at £4,626,000.

— HYBRID HEATHS. — In another column will be found an account of a tribute of respect honestly earned and worthily paid to one of the most eminent of Scotch gardeners. To his fellows there is no need for us to dilate on his merit. Nevertheless, for the benefit especially of the generation now rising up, we venture to call special attention to the record now given of his achievements and of his career. The details Mr. TURNBULL supplies as to the history of the cultivated *Ericas*, in whose origination and culture he has played so distinguished a part,

FIG. 34.—WATER PLANTS. (SEE P. 176)

first tenant-farmer returned to Parliament from Scotland, and the second in Great Britain.

— THE LAW OF FIXTURES. — We note that the important paper on this subject, which was read by Mr. J. SMALMAN SMITH, Barrister-at-Law, at a late meeting of the Institution of Surveyors, together with the discussion which followed, is published in full in the current number of *The Estates Roll*.

— THE LATE SEVERE FROST IN FRANCE. — The following extract from a letter received from the Messrs. TRANSON, of Orleans, has been sent to us by Mr. CHARLES LEE, of Hounslow:—"Acacia, Cerasus, Crataegus, Euonymus, Laurus, Roses, Ligustrum, Peaches, Platanus, Prunus sincensis are all injured, and you may have an idea of our losses if we mention that the Cedars of all kinds, Abies

or the coming year, declining that honour, Sir CHARLES W. STRICKLAND, of Hildenley, Malton, a well-known horticulturist and member of the Council of the Royal Horticultural Society, will take the position.

— THE "AMERICAN ENTOMOLOGIST." — We have received the first number of a new series of the *American Entomologist*, which has been brought out under the joint editorship of Prof. C. V. RILEY, of Washington, and Mr. A. S. FULLER, of Ridge-wood, New Jersey. This interesting monthly was started originally by Prof. RILEY and the late Mr. WALSH, but from various causes ceased to be published nine years ago.

— THE IRISH POTATO CROP OF 1879. — Dr. HANCOCK, the eminent Irish statistician, estimates

are exceedingly interesting. There is one part of his statement upon which we are in a position to throw some light. It seems that in the times of which Mr. TURNBULL was speaking, it was considered by a certain section of no doubt worthy people to be almost an impious thing to raise hybrid plants. It was deemed a sacrilegious interference with the laws of the CREATOR, and so strong was this prejudice in certain quarters that some of the nurserymen at that day were fain to conceal the hybrid parentage of the plants they offered, and to catalogue them as if they were imported species from the Cape! The groundlessness of such a prejudice seems preposterous enough now-a-days, but it must be remembered that in the earlier volumes of this journal similar objections were raised to the theory of the metamorphosis of flowers, which, in substance, is now everywhere adopted, and is not found to have had such terrible

results as was anticipated. Indeed, like any other advance in our knowledge of the CREATOR'S works, it must of necessity tend to higher and deeper notions and enhanced reverence for Creative Wisdom. In a few years' time theological (as contradistinguished from religious) objections now sometimes raised to certain current scientific notions, will seem as preposterous as it does now to us to remember that to the minds of some people it was considered impious to raise hybrid Heaths, or formulate theories as to the plan upon which flowers are constructed.

— INTERNATIONAL AGRICULTURAL EXHIBITION AT HAMBURG IN 1882. — A committee has been formed in Hamburg for the purpose of arranging for an International Agricultural Exhibition to be held in that city in 1882. The first and only exhibition of this kind held there was in 1863.

— SUTTON'S MAGNUM BONUM POTATO. — A correspondent who has heard that in the schedule of prizes to be offered for competition at the next International Potato Show, a class will be again introduced for the best dish of "Sutton's Magnum Bonum," writes to ask, "in no joking spirit," as he puts it, whether the "improved" forms of the same variety, offered for sale by other firms, will be eligible; because if they are not—and it is difficult to see how they can be—the committee should make the fact known.

— HOAR FROST. — Natural phenomena, seen under any aspects, are never lacking in interest, and oftentimes in beauty; there may be diversities in their capacity to produce enjoyment, because some have surroundings that are so pleasing as to admit only of the keenest pleasure, whilst others can be seen only under conditions that may be productive of discomfort, or even danger. The marvellous visitation of hoar-frost, or rime, seen throughout all the midland district last week was a phenomenon that comes only in the latter category; for singularly beautiful—nay, even majestic—as was the spectacle presented by all kinds of vegetation, yet the intense moist cold and fog that prevailed added elements of discomfort and danger that detracted immensely from the pleasure incidental to the sight of such an unwonted spectacle. Four days of successive fog, at times of the thickest description, and as many nights of intense frost, produced on the trees and plants such a coating of silvery sheen as perhaps few living persons have before seen. We have heard of the great coatings of rime in years past that presently broke down branches from trees as though over-weighted with snow, but such mishaps scarcely resulted last week; still the accumulation on even the tiniest spray was marvellous, the encrustation increasing day after day as the thick fog came into contact with the frosted wood or leafage, and the vaporous particles were solidified. Not a glance of sunshine, not a current of air, intervened to relieve vegetation of its unwonted load, but much of the frozen vapour fell of its own weight, unable longer to sustain the continuous accumulation of matter. When at length the end came the rime lay beneath the trees several inches in thickness, like a heavy snowfall—a covering of snow without a snowstorm. Popular tradition has it that rain will inevitably follow upon three successive white frosts. Although falsified a thousand times the tradition has yet abundant believers. To have got such wondrous hoar-frosts in one of the driest winters in the memory of man is perhaps unusually remarkable; but to have such frosts and no rain following must prove a death-blow to the old tradition henceforth. In years to come we shall oft quote the month of January, 1880, as the time of the great hoar-frosts, and tell of all their wondrous effects and beauties.

— THE FLORA OF ST. CROIX AND THE VIRGIN ISLANDS. — Baron H. F. A. EGGERS has published in the *Bulletin* of the United States National Museum, issued under the direction of the Smithsonian Institution, a classified list of the plants of the Central West India Islands above named, prefaced by an interesting note on the physical features of the islands in question. It may be of interest to growers of West Indian plants to note that the yearly mean temperature of the islands is 27°.2 C., the coldest February being 25°.6 C., the warmest 28°.9, a difference of 3°.3 only. The same uniformity is observed in the daily variation, which scarcely ever surpasses 5° C. The differences in temperature are therefore in-

sufficient to produce much variation in the development of vegetable life at different seasons. Differences in the amount of moisture have more effect. The moisture of the atmosphere is comparatively small in amount, owing to the high temperature and the frequent high winds. There is thus a high amount of evaporation from plants, rendering it necessary for them to receive a large supply of water. The average rainfall is about 42 inches—February being the driest month, 1.5; October the wettest, 7 inches. The number of days on which rain falls averages 161. The rainfall is therefore slight for a tropical district, a fact explained by the low elevation of these particular islands, and the consequent relative absence of precipitation. The vegetation as a whole is not different from that of the other West India islands, and may, like it, also be divided into four groups—the littoral, the shrubby, the sylvan, and that pertaining to the region of cultivation.

— BEAN-CAKE MANURE IN CHINA. — Bean-cake is, it appears, the principal manure used in the South of China both for Rice and Sugar cultivation. It is annually imported into Amoy to the extent of about 300,000 piculs, and so far the attempts to supply its place with guano have proved fruitless, the cultivators saying guano stimulates but bean-cake nourishes the earth, and though a larger crop is obtained in the first year the land is exhausted by the use of the former.

— THE FLUKE KIDNEY POTATO. — The particular type or variety of the Potato, like the typical dog, has its day. It is now many years since this variety was raised by a Lancashire weaver, from, it is said, seed of the Lapstone; and when it became known, to such an extent was it appreciated that the highest character was given to it as a cropper, while for its fine quality as a keeper and a disease resister, it was thought by some to be a variety for all time. At that time it was pitted against Regents, Lapstones, and others, and pronounced to be superior in every respect. It is still grown somewhat largely in Lancashire and adjacent counties, but it has ceased to occupy a place as a leading garden variety. It is occasionally met with grown by some one who swears by it and prefers it to all the new varieties of recent years. It yet exists, with the Ash-leaf, Regent, and Lapstone, and is likely to be grown for years to come; but it has fallen from its former high estate, as some that are now exalted to such a position surely will before many years have passed over our heads. And now that new varieties are being much more freely introduced than they were a few years ago, the struggle for existence is intensified, and shorter in its duration. Of one thing we may be certain, that good Potatoes, like the poor, will not cease from the land.

— ORCHIDS FLOWERING IN JANUARY. — The following is a list of the Orchids which have been in flower during the past month at Forest Farm, Windsor Forest, the residence of JOHN C. BOWRING, Esq. :—

Angreæum distichum	Epidendrum erectum
" eburneum	" sp. from Jamaica
" sesquipedale	Laelia carinata
Barkeria elegans	" anceps
Calanthe vestita	Leptotes bicolor
" lutea	Liparis sp.
" Veitchii	Lycaste Skinneri, many vars.
" Turneri	Masdevalia amabilis
Celia bella	" nycteria
Cyclopogon cristata pandurata	Maxillaria crassifolia
Cypripedium barbatum	" densa
" insigne	" pallidiflora
" longifolium	" variabilis
" pardinum	Odontoglossum cirrosium
" purpuratum	" crispum
" Roezlii	" leopardinum
" Schlimii	" Pescatorei
" Sedeni	" pulchellum
" stenophyllum	" majus
" villosum	" roseum
Cymbidium giganteum	" Kossli majus
Dendrobium album	" Uto-Skinneri
" crassinode Barberianum	Oncidium cheiroporum
" Fendleyanum	" aureum
" heterocarpum	" obryzatum
" moniliforme	" serratum
" nobile	" auroum
" primum	Pescatorea Dayana splendens
" superbiens	Phaius maculatus
Epidendrum cuspidatum	Sophronites grandiflora
" equitans	Zygopetalum Mackayi

— PRESERVED VEGETABLES IN FRANCE. — As is well known a large trade in what is called tinned goods is carried on at Nantes in France; these goods consist chiefly of sardines, tunny fish, lobsters, green Peas, Asparagus, Choucroute, &c. The plantation of German Cabbage for making Choucroute has succeeded very satisfactorily in the district of Nantes.

In 1878 about 170 acres of land were planted with this Cabbage, which produced upwards of 500,000 heads, equal to 750,000 kilos. of Choucroute. It is only within the last two years that this manufacture has been undertaken, and it promises to be most successful, and to compete seriously with the productions from Alsace, which are now subject to duty on being imported into France. Independently of what is sold in France, large quantities are exported to England, America, and the French colonies. A very important contingent of the trade, we are told, is the manufacture of the boxes, which gives continual employment to numerous establishments. On an average 12,000,000 boxes are annually turned out, of different patterns, for fish and vegetables. Some makers work solely for certain houses, others sell what they make to the best purchaser. The boxes for exportation to Spain and Algeria for sardines, and to Singapore, Cayenne, and Martinique for preserved Pine-apples, are sold either finished or cut and prepared for soltering, so as to save the expenses of carriage. About 4,000,000 boxes are exported annually.

— SEWAGE FARMING. — At the monthly meeting of the Council of the Royal Agricultural Society, held on Wednesday last, under the presidency of the Duke of BEDFORD, the report of the judges of sewage farms (Mr. C. S. READ, M.P., Mr. BALDWIN LATHAM, and Mr. T. H. THURSFIELD) entered to compete for the prizes offered last year was read, and in accordance with their recommendations the Council decided to award the prize (of £100) in Class 1, for farms utilising the sewage of not more than 20,000 people, jointly to the Corporation of Bedford and to Lieutenant-Colonel A. S. JONES, V.C., of Wrexham, their respective farms being, in the opinion of the judges, equal in merit. In Class 2, for farms utilising the sewage of more than 20,000 people, the prize of £100 was awarded to the Earl of WARWICK, for the Leamington Sewage Farm. A special prize of £25 was given to Mr. R. S. BRUNDELL in connection with the sewage farm of Doncaster, which was stated to be an admirable example of thrifty management, and showed how sewage can be applied to general farming. The sewage farm of the Birmingham, Tame, and Rea District Drainage Board was highly commended.

— DEATH OF THE REV. HENRY MOULE. — The Rev. HENRY MOULE, Vicar of Fordington, near Dorchester, died on Tuesday last, at an age not far short of eighty years. He was in 1829 appointed to the living of Fordington, which he held for half a century. He was the author of very many works on religious, social, and industrial subjects, and also the inventor of the "earth closets" now so generally adopted in country houses and public institutions. In support of this invention he published several small works—*A Letter on the Dry Earth System*, *The Science of Manure as the Food of Plants*, *The Advantages of the Dry Earth System*, *Land for the Million to Rent*, *National Health and Wealth*, &c.

— THE WEATHER. — General remarks on the weather during the week ending February 2, issued by the Meteorological Office, London :—The weather during this period has been fine and dry over the greater part of England, but fogs of exceptional density and duration have prevailed in the south-eastern counties; rather cloudy or overcast in Scotland, and generally dull and squally in Ireland, with rain at times. The temperature was again several degrees below the mean in England, but as much as from 3° to 5° above at the Irish and Scotch stations. Very low readings were recorded over England during the first three days, but by noon on Jan. 30 the warmer weather prevailing in the West had extended to all districts, and on the following day the thermometer rose to 56° at Loughborough, and 55° in London. The lowest of the minimum readings (9°, at Marlborough) occurred on January 28. The wind was generally fresh to strong from S.W. at all our western and northern coasts, reaching a gale in the N.W. on the 31st. In the south-eastern districts calms or variable airs were experienced. The rainfall was again less than the mean in all parts of the kingdom, the deficit being only slight in Ireland, but amounting to several tenths in England and Scotland.

— GARDENING APPOINTMENT. — Mr. ALFRED BISHOP, Manager of Mr. WILLIAM BISHOP'S nursery at Wells-next-Sea, Norfolk, and late Foreman to Mr. WARD, Gardener to Baroness WINDSOR, Hewell Grange, Worcestershire, has been appointed Gardener to E. G. GIBSON, Esq., Grange House, Saffron Walden, Essex.

## MR. TURNBULL.

On January 28 a number of the friends of Mr. Andrew Turnbull, of Bothwell Castle, invited him to meet them in the St. Enoch's Station Hotel, Glasgow, to receive a present, consisting of a gold eye-glass and a purse of 170 sovereigns. A. B. Stewart, Esq., of Ascog, occupied the chair, and called upon Mr. Thomson, of the Tweed Vineyard, to make the presentation, which he did in the following terms:—

As representing your numerous friends in various parts of the country we have asked you to meet us here to-day, that we may have the great gratification of presenting you with a small token of our profound respect for you as a man, and our high appreciation of the great services you have rendered to the profession of which you have for more than half a century been an ornament, in the hybridisation and raising of so many improved varieties of plants, more especially of that grand genus the *Erica*. Only those who have a thorough technical knowledge of such matters can form the slightest conception of the amount of thought, skill, care, and plodding perseverance you have brought to bear on this one subject, and the results have surely been equal to the most sanguine hopes you could have cherished. Any one who saw the Heath-house under your care last autumn as I saw it, containing as it did thirty-three of your own seedlings in full bloom, would be disposed to say "Rest and be thankful." All this has been achieved in the utter absence of any mercenary consideration, and out of pure love for the subjects you were manipulating. As the work of one man, I know of no achievement of the same character to compare with it. Those grand Heaths, some of which are in the hands of the public already, are destined to hand down your name and reputation to men yet unborn. When asked to occupy the position I do here to-day, while I could have wished some one more capable of doing the occasion justice had been selected, I felt at the same time that there was an appropriateness in the selection, in as far as I am now nearly your oldest friend. It was my good fortune to be sent to you as a journeyman gardener by the late Mr. J. Austin on December 13, 1832, an event which I have always looked upon as a most fortunate one for myself. Ever honourable and upright in your conduct, you have been an example to your men in all the relations of life that you have occupied. I heard from the lips of your aged father, forty years ago, what a good son you were to him—I know from your brothers and sisters, all gone before you, how well you sustained that relationship. As a master you have ever been just and honourable, anxious to advance the best interests of your men, but always requiring them to do their duty as you did your own. As a servant you have been trusted and highly respected by a succession of noble employers, to whose interests you have devoted an amount of practical skill and energy that rarely fall to the lot of any man, and this for a period of more than fifty years. In view of all these circumstances you cannot be surprised that we, who are mostly interested in pursuits similar to your own, have desired thus to give expression to the feelings we cherish towards you, by presenting you, as I do now, with a gold eye-glass, a purse of 170 sovereigns, and an engrossed address signed by us in the name of 150 subscribers, a list of whom I now hand you. That you may live many years in the enjoyment of good health is the sincere wish of all your friends.

In reply Mr. Turnbull said:—

I have always shrunk from everything like speaking in public, and must just thank you heartily for placing me in a position I never expected to occupy, and though it may not adequately express my feelings, I do not the less feel and appreciate your kindness in making me such a handsome and valuable presentation, which I gratefully accept on the ground of my having done something for horticulture, though I fear the kindness of my friends has overrated my claims.

Reference was incidentally made in the circular sent to my friends to my unfortunate connection with the City of Glasgow Bank, and though this connection swept away the savings of a long life, I never felt seriously depressed. I was thankful in the possession of my health, and in the continued duties of a situation I have held for more than fifty years, under a succession of noble and generous families, who have always been liberal and kind to trustworthy servants; and while I received many kind letters of sympathy from friends referring to my loss, by far the kindest and most considerate were from the Earl of Home and Lord Douglas. The latter is now my sixth employer at Bothwell Castle, where, though it is his lordship's smallest estate, I pay £200 a year chiefly to labourers no longer able to work, or the widows of such as have died in service. I am induced to make these remarks to correct an impression made in some quarters that this testimonial was either necessary or intended to

compensate in some measure for my losses through the bank—on no such grounds could I have accepted it.

## EXPERIMENTS IN HYBRIDISING.

Reference has been made to my efforts to improve various genera of plants by hybridisation. I began with the *Calceolaria*, at an early period of its history, and raised varieties that were thought good in their day, but I daresay very few know now that the first hybridiser of the *Calceolaria* was my highly esteemed friend, the late Mr. Wm. Morrison, then gardener to Lord President Hope, at Granton. His finest lot of hybrids went to Messrs. Young, at Epsom, in 1829, as far as I remember. Heaths, however, have been my favourite tribe of plants, and on entering my present situation my then employer, Archibald Loud Douglas, said that the Heaths were in an unsatisfactory state, and he wished them improved. I needed no stimulus to effort in this direction, and I had the satisfaction of being told by the late Mr. Wm. MacNab, of the Botanic Gardens of Edinburgh, some ten years after I took charge of them, that they were the best house of Heaths he had ever seen. I then had *Erica retorta* 6 feet in diameter, and a plant of *E. elegans* of the same size.

With regard to the hybridisation of Heaths, I commenced that shortly after I came to Bothwell Castle. I was not then aware that Messrs. Rollisson, of Footing, had practised it for twenty years before me; this I learned from Mr. Cunningham, then of Comely Bank Nurseries, Edinburgh, and a short time after I saw a list of Heaths, said to be hybrids, raised by them, and was surprised to see amongst them some we had always considered distinct species from the Cape, and as such, the date of their introduction given in Loudon's catalogue, ranging from eighty to one hundred years from the present date. To some of these I have been indebted for my best hybrids. From *Irbyana*, crossed with *retorta*, I raised *Jacksonii*; from the same female parent, crossed with *Hartnellii*, I raised *Marnockiana*; and I raised some very good varieties from *Aitoni*, a hybrid raised by Messrs. Rollisson. As this variety is so widely different from any Heath I know, it would be interesting to know its parentage. From it, crossed by *jasminiflora alba*, I raised *Aitoni*, *Turnbullii* and *Lady Mary Scott*, the latter an extra fine distinct Heath. From *Aitoni* crossed with *Macnabiana* I raised *E. Turnbullii*, and from the latter crossed with *Marnockiana* I have raised three excellent and very distinct Heaths, one of which I have named *Countess of Home*, the others I have not yet named. *E. Douglasii* was raised from *Aitoni* crossed with *retorta major*. I have raised a very good seedling from *E. ferruginea* crossed with *Marnockiana*, which I selected from fifty seedlings of a batch, and named *E. ferruginea Bothwelliana*. *E. Lord Douglas* is an extra fine Heath, raised from an unnamed seedling crossed with *Marnockiana*. *Austiniana* was also raised from an unnamed seedling crossed with *retorta*. I have also fine seedlings raised from *E. Shannonii*, much superior to the original; but it would be an endless task to enumerate all the seedlings I have raised, and the hundreds I have thrown away for every one I kept. At first I freely gave away such as I did not think worth keeping, and I sometimes met with them under a grand name, and gave no more away.

I think much might still be done for the improvement of hard-wooded Heaths, though the process is tedious. I have sown seed and waited two, and sometimes three years before it vegetated, and then three or four more years before I saw them flower, yet the interest excited in watching their opening flowers was an ample reward. Many Heaths introduced from the Cape as species are in my opinion natural hybrids, as several varieties can be raised from the same pod of seed without impregnation. For example, *E. ventricosa Bothwelliana alba* is such a seedling from *E. ventricosa superba*, a very dark flowered sort.

I observe that a writer in the *Gardener* gives me credit for raising several varieties of *E. ventricosa*, notably the *ventricosa Bothwelliana* variety. Now I did not raise that Heath, nor was it raised at Bothwell Castle at all. Woodhall had then a collection of Heaths as Bothwell Castle had, and there was a distinct variety of this Heath at each place—the one was named the *Bothwell Castle* variety, and the other the *Woodhall*; the latter was the best, and I have ceased to grow the former. The Heath now known as *E. ventricosa Bothwelliana* was what I grew as *E. pregnans major*. Cuttings of it got to London, and it was believed to be one of my seedlings, and was there named *E. ventricosa Bothwelliana*. *E. ventricosa Bothwelliana alba* is the only one of that section that I have raised.

It would be ungrateful in me were I not to state before I sit down that I have been fortunate beyond most men in having under me very able young men, fond of their profession, who rendered me valuable assistance in conducting my horticultural duties at Bothwell Castle. Some are now no more, others are my highly esteemed friends and ornaments to their profession, none more so than my friend whom you have selected to present me with such a valuable token of your respect, for which I again desire to return you my most respectful thanks.

Mr. Turnbull sat down amidst great applause, and Mr. Stewart proposed his health, comparing him standing in his Heath-house looking down the vista of time to Methuselah looking down amongst the generations that proceeded from his loins; and expressing the opinion that Mr. Turnbull's progeny were, in all probability, the most orderly and easiest managed of the two families.

The address, which was beautifully engrossed on vellum, with a border of Heaths, *Calceolarias*, and the other flowers Mr. Turnbull has done so much to improve painted round it, reads as follows:—

"Presented to Mr. Andrew Turnbull, Gardener, Bothwell Castle, on the completion of his fiftieth year as gardener there, along with a gold eye-glass and purse of 170 sovereigns, by his numerous professional and private friends, as a mark of their profound respect for his private worth, and their high appreciation of his practical ability as a horticulturist—more especially the wonderful success of his labours in raising many splendid hybrid Heaths, *Calceolarias*, &c.; and with every good wish for his future prosperity."

The address was signed by the Chairman and a number of Mr. Turnbull's oldest friends present, including Mr. Hunter, of Austin & McAslan; Mr. McLellan, the Superintendent of Parks, Glasgow; Messrs. Thomson, of Tweed Vineyard and of Drumlanrig, respectively; Mr. Cairns, The Hirsle, and others. A portrait of Mr. Turnbull was given in our columns in 1874, p. 328, together with some autobiographical details of great interest.

## THE CHINESE TREE PEONY.

ACCORDING to Loudon the first plant of the Tree Peony reached Europe in 1787. In the *Arboretum et Fruticetum Britannicum* we find the following notice of it:—"From Chinese drawings, and from the extravagant praises bestowed upon this plant, in the *Mémoires sur la Chine*, published by the missionaries, an ardent desire was excited in Sir Joseph Banks and others to import plants into England; and previously to 1786 Sir Joseph Banks engaged Mr. Duncan, a medical gentleman attached to the East India Company's service, to procure a plant for the Royal Garden at Kew, where it was first seen, through Mr. Duncan's exertions, in 1787."

"One of the largest Tree Peonies within 10 miles of London stood till lately in the grounds of Spring Grove, where it was planted by Sir Joseph Banks. It was 6 feet or 8 feet high, and formed a bush 8 feet or 10 feet in diameter in 1825. South of London there are equally large plants at Rook's Nest, near Godstone, Surrey, which were planted in 1818. North of London the largest plant in the country is at the seat of Sir Abraham Hume at Wormleybury, in Hertfordshire. It is 7 feet high, and forms a bush 14 feet in diameter after having been planted thirty years. . . In the year 1835 this plant perfected 320 flowers, but it has been known to bear three times that number." Loudon also mentions some large plants in Scotland, at Hopetoun House, and Dalkeith Park.

From these extracts it would seem that the Moutan succeeds perfectly in England, and yet somehow it never becomes popular, and is never generally cultivated in this country. I shall now endeavour to point out what I believe to be the reasons of our failure, and to show how the Tree Peony can be successfully cultivated in Europe. When we consider the great beauty of the plant, its noble flowers, and the diversity of its colouring, it certainly deserves our best attention. And now let me give a short notice of its history.

The Tree Peony is found wild on the mountains of the central provinces of China, and is cultivated as a garden plant in all parts of the Empire. It was first seen by Europeans in the gardens about Canton, but it is not indigenous to that part of China. The Canton gardeners carry on a large trade with the Moutan growers, who bring the plants yearly in boats from the provinces of Hoo-nan and the western parts of Kiang-nan, a distance of at least 1000 miles. This takes place in winter when the plants are leafless and in a state of rest; the roots are packed in baskets, open at the top, with scarcely any soil adhering to them: in this simple manner they are distributed over all the Empire without suffering any injury. On their arrival in the South they are immediately potted by the purchasers, and owing to the difference in the temperature soon come into bloom. As

soon as the flower-buds are fairly formed the plants are eagerly bought up by the natives to ornament their balconies, halls, and gardens. The price of each plant depends, not upon its size or strength, but upon the number of flower-buds it has upon it. This is reasonable enough when the circumstances of the case are considered. The Moutan, when brought into the hot climate of the South will not thrive for any length of time. As it is strong and vigorous when received, it blooms well the first year, but, being deprived of its natural period of rest—that is, a cold winter—it soon gets out of health, and although it may continue to exist, is ever afterwards quite worthless as an ornamental flower. The Southern Chinese rarely attempt to preserve it after it has once bloomed. This circumstance keeps up the constant yearly trade between the Moutan country and Canton. This, then, is the first lesson in Moutan cultivation—that is, we may give it as much heat as we like in summer, but it must have a period of perfect rest in winter.

I may mention here, that a few years ago Mr. Bateman presented to the Royal Horticultural Society his collection of Moutans for their gardens at South Kensington. They were in the most perfect health, and with proper care ought to have done admirably. But this mistake was made—they were planted in a house which was heated in winter; in fact, they were treated like the Canton plants, and I fancy met with the same fate.

When I discovered the Moutans in the garden near Shanghai, I found that the varieties were mostly different from those met with at Canton. The Shanghai country had not been visited by the Canton florists. The Chinese are a curious people in many respects. They had discovered the plant in Hoo-nan and Kiang-nan, and kept on from year to year supplying themselves from those quarters. Thus nearly all my plants were new, and very beautiful many of them were. Among the colours of the flowers were red of many different hues, white, blush, and lilac, all exceedingly beautiful. In my instructions from the Horticultural Society I was told to look out for a blue Moutan; I found a lilac one, which was pretty near it. And where are all these fine varieties now? I fear most of them are lost to our gardens.

I have already said that the Moutan requires a warm summer, and a complete rest in winter. That it will succeed perfectly in England is proved by the examples I have already given at Spring Grove and other places. Why then should such a beautiful plant be so much neglected? I think I can point to the cause, and I shall now endeavour to do so.

The propagation and management of the plant seems to be much better understood by the Chinese about Shanghai than in England. Our nurserymen always complain that they cannot propagate it with facility, and consequently this fine flower is invariably high in price. Let me now point out the Chinese method of propagation.

Propagation by suckers and cuttings is completely ignored. In the beginning of October large quantities of the roots of a herbaceous Peony are seen heaped up in sheds and other outhouses, which are intended to be used as stocks for the Moutan. The bundles of tubers which form the root are potted in pieces, and each of the finger-like rootlets forms a stock upon which the Moutan is destined to be grafted. Having thrown a large number of the rootlets upon the potting bench, the scions are then brought from the plants which it is desirable to increase. Each scion used is no more than 1½ inch or 2 inches in length, and is the point of a shoot formed during the bygone summer. Its base is cut in the form of a wedge, and inserted in the crown of the finger-like tuber. This is then tied up and clayed round in the usual way, and the operation is complete. When a large number of plants have been prepared in this manner they are taken to the nursery, where they are planted in rows about 1 foot or 1½ foot apart, with the same distance between the rows. In planting, the bud or point of the scion is the only part which is left above-ground; the point between the stock and scion, where the union is destined to take place, is always buried beneath the surface. Kæmpfer states that the Chinese propagate the Moutan by budding; but this must be a mistake, as budding is never practised in the country, and is not understood.

Many thousands of plants are grafted in this manner every autumn, and the vacant spaces which one sees

in the rows attest the success which attends the system; indeed it is rare that a graft fails to grow. In about a fortnight the union between the root and the scion is complete, and in the following spring the plants are well established and strong. They frequently bloom the first spring, and rarely later than the second, when they are dug up and taken to the markets for sale. When each has only one stem and one flower-bud, it is of more value in the eyes of the Shanghai nurseryman than when it becomes larger.

I have thus shown that the Moutan can be easily cultivated in Europe, I have given its history in China, and pointed out that it requires a period of rest in winter; I have also described how it is cultivated and propagated in its native country. I may add that I sent home a large quantity of the herbaceous kind which the Chinese use as a stock for grafting, to Messrs. Standish and Noble, many years ago. This is probably in the country, and may still be procured.

In conclusion, I have only to add that were our country gentlemen, nurserymen, and gardeners to take to the cultivation of the Moutan, they might be perfectly successful and would be well repaid for their trouble. Let us hope that horticultural and botanical societies may take the matter up, and add another feature to the splendour of the flower shows. *Robert Fortune.*

## LONDON MARKET FLOWERS.

PEOPLE connected with gardening, who for the first time see Covent Garden Market, usually express their surprise at the very few kinds of plants and flowers there to be met with as compared with what they expected. Neither is this to be wondered at when account is taken of the immense number and variety of plants cultivated under glass in private establishments. There are several causes to which this state of matters is attributable. It is no use for the growers to provide things which the public do not appreciate, for the public are much more conservative and less prone to change for the sake of novelty in the matter of plants than in most things. When once a plant becomes an established favourite with the many, it usually remains so for an indefinite time, and even if something better in its way appears, it takes the newcomer a considerable time to establish its superiority. The habit of the plant has also a good deal to do with its being generally accepted as a favourite; if a flowering subject it must be a profuse bloomer, and, with few exceptions, dense and compact in outline. Those that are wanted possessing more elegance and graceful habit are sought for amongst the Ferns and other fine-leaved subjects, such as Palms, Dracænas, and the like. The flowers likewise need to be of a fairly lasting character, and produced in succession. The plant, to be of any use for market, must be of such a nature as to carry well without liability to bruise or suffer by the chafing inseparable from carriage, and, above all, it must be easily propagated, free of growth, and quick in coming to a saleable condition, so as to admit of its being sold cheap.

In the case of cut flowers, they must be able to last fairly: the bloom of a day's duration, no matter how beautiful, is of no use. The colours must be decided and pure; light shades, especially white, much in excess of those that are darker, and a proportion are required to be sweet-scented. When all these essentials are added together, it will be easily seen that there is sufficient reason to account for the comparatively few plants that become favourites in the market; and amongst the limited number of kinds of both plants and flowers that are thus in demand there are few, if any, of even the most extensive growers who do more than cultivate a portion. Many there are who almost confine themselves to some half-dozen things. To this cause is traceable the uniform excellence of the market plants, and, taking into account the very small pots they are grown in—most of them in 48s—it would be very difficult to surpass the different subjects coming from the best growers.

Every peculiarity of the individual variety of plants grown is studied and soon discovered, and it often happens that a single sort out of scores or even hundreds, of the species or varieties, is found to distance all others of the respective family to which it belongs. Take, for instance, Zonal Pelargoniums, the names of which, as everybody knows, are legion, yet amongst the hundreds that have been named and sent out nearly all that the market-men care to have may be counted on the fingers of one hand. So it is with

Roses for cutting. Out of the host of names that are to be found in the catalogues of the great Rose growers, how few meet the market grower's requirements for forcing? Of the white Tea variety, Niphetos, there is in all probability grown double the quantity of all others put together, some of the largest cultivators of forced Roses growing little else but this kind; and the same holds good with most other things.

Messrs. Beckwith, of Tottenham, have long been amongst the greatest and most successful growers for market, and although they go in for a greater variety than most others alike engaged, yet they have a few things which receive their particular attention, and for which they are especially noted, amongst these being the following:—

### BOUVARDIAS.

With these one after another of the immensely long houses may be seen filled and in bloom during the autumn and winter, until the visitor begins to think he is never to see the end of them. Last summer 25,000 were grown for selling when in flower, and 16,000 for cut bloom alone, all propagated from shoot cuttings, the plants to produce which are subjected about the end of the year to a short drying-off process, not unlike the way in which Fuchsias are often treated, by withholding water. As soon as all growth is thus stopped the points of the shoots are removed, the plants placed in a brisk heat, and the soil moistened; they break quickly all over, and furnish a full crop of cuttings in February, which are at once taken off and struck in a temperature similar to that which the plants that produce them have been submitted to. Directly they are rooted they are put singly into 60-sized pots; in April they are moved to those they are to flower in (48s), and kept in the same temperature they have been in all along (about 70°); they are stopped and remain in heat until half their growth is made, after which in the summer they are plunged out-of-doors and left there till September, when they are again removed to the houses. All except those not wanted to bloom before late in winter are subjected to heat varying in extent with the particular time they are required to be in flower, the bloom coming much the finest and in greater quantity with a temperature of 70°, which, as near as can be, is maintained with little variation night or day.

The plants grown as they are here, strong, furnish an immense quantity of flowers; 1000 bunches are cut per week all through the autumn and winter months, twelve trusses in each bunch. The daily work of cutting and preparing for market the produce of such portion of the stock as is kept for cutting is no slight affair. Even in December the Bouvardia, Roman Hyacinth, and Chrysanthemum bloom occupies four men half of every day in gathering and packing. The varieties grown are Hogarth, red; Elegans, a sport from Hogarth; and another sport which Messrs. Beckwith have obtained, also from Hogarth—a most beautiful variety, very bright, and of a considerably higher shade of colour than Elegans; Flammea, bright pink. Of whites, Candidissima, Jasmiflora, Vreelandii, and Humboldtii corymbiflora, the latter kept for the latest flowering in spring.

### PELARGONIUMS.

These are grown to the extent of 70,000 yearly, all consisting of the larger flowered section—no Zonals. Messrs. Beckwith have given especial attention to Pelargoniums, to ascertain which are the best varieties for coming in, so as to afford the requisite succession of flowers, from those which will bear forcing earliest, on to such as come in in regular succession afterwards. Their earliest kinds are blooming and in the market in February, and it is needless to say that any such to be in so soon must stand forcing, and not only forcing in the sense in which gardeners usually understand the term when applied to this class of Pelargoniums, but able to bear, without becoming drawn in the least, considerably more heat than most people would think possible without producing a weakened condition of the plants. The varieties found best to stand the requisite high temperature for flowering so early are nearly all of market origin, that is, they have been raised by the market growers, and in a great measure their cultivation has so far been mostly confined to this class of growers, although there can be little doubt that they are equally suitable for growth in private gardens where early flowers are wanted, as these kinds possess all the essentials requisite in a good decorative plant.

Messrs. Beckwith grow four sorts for their earliest—*Virginalis* (Sweet), white and purple spots; *Reflection* (Weatherell), scarlet shaded with purple; *Smith's Seedling*, French-white, with carmine spot on each petal; and *Monte Christo*. The first-named is the earliest, and might be had in, at, or soon after Christmas if wanted. The temperature kept up for these through the winter is from 50° to 60° in the night; they are syringed overhead daily, and receive manure-water to the roots at short intervals. Plenty of air is given in the daytime with a brisk heat maintained to admit of this. The plants bear no signs of the forcing they are thus submitted to, but are as stout and short-jointed as we usually see them under ordinary treatment. *Triomphe de St. Mandé* (Chaté), sent out by Turner, rich deep crimson, large truss, very free bloomer, dwarf sturdy habit. This Mr. Beckwith considers the best market or decorative *Pelargonium* in cultivation, and he grows 10,000 of it. The following sorts, raised by Mr. Brown, of Hendon, are also grown in quantity:—*Mermerus*, crimson; *Mermerus Improved*; *T. A. Dickson*, crimson, deep maroon blotch; *Integrity*, bright salmon; *Alliance and Harry Buck*; *Duchess of Edinburgh* (Braid), white; *Duchess of Bedford*, white, but purer than *Duchess of Edinburgh*. The show varieties, as these make their appearance, are tried, and amongst them the following are found to answer for market work:—*Lord of the Isles*, *Sovereign*, *Victory*, *Rob Roy*, *Mabel*, *Illuminator*, *Sappho*, *Viscount*, and *Yorkshireman*.

FUCHSIAS.

As might be supposed, Fuchsias hold a prominent place here, 50,000 being yearly grown for flowering, and more than double that number are propagated. The first lot are struck in December, and these are full of bloom and in the market in April. The time of the year during which all their growth has to be made, and the early season they come into bloom is sufficient indication of the warmth necessary to be kept up to accomplish this. Most people who are only acquainted with the ordinary method by which Fuchsias and similar plants are cultivated, would suppose that when grown in heat such as here described they would flag, and both flowers and leaves drop off directly by exposure to the air in a temperature so much lower than they have been grown in, and to which they are unavoidably subjected, first in the market and afterwards at the hands of those who buy them. But if this were the case, the trade would very soon come to an end, for plants that are found not to stand soon cease to be saleable. These market plants grown in heat are simply evidences of what can be done in houses that give all the light possible, with other matters in their cultivation of equal importance alike skilfully carried out. With Fuchsias again, a compact habit of growth, free disposition to flower, and ability to stand heat are indispensable. The following sorts are found to bear this kind of treatment:—*Lady Heytesbury*, white sepals, corolla rosy-purple; *Delight*, corolla white, sepals and tube bright crimson; *Crown Prince of Prussia*, violet corolla, tube and sepals scarlet; *La Belle Elise*, *Red Marshall*, and *Lucy Finnis*.

SOLANUMS.

These are done in quantity; 15,000 were grown last summer, all from cuttings—the stock plants to produce these selected for their general habit of growth and profuse disposition to berry. Those are chosen that throw their berries well up above the foliage, and are thus more conspicuous. The cuttings are struck in November. By getting them going thus early the plants flower much sooner, the berries, as a matter of course, attaining their size and colour proportionately earlier; the earliest this season, notwithstanding the wet sunless summer, were fully coloured at the beginning of autumn. The remains of stock left over and for propagating were amongst the best grown plants of their kind I have ever seen; from 15 to 18 inches across, and not more than 12 inches high. One house, 130 by 21 feet, was filled with plants for Christmas completely clothed with their bright berries.

TREE CARNATIONS.

These are forced largely, for which purpose 10,000 plants are required; the principal sorts used are *A. Alegatière*, scarlet; *Beauty of Scarborough* in the same way, also scarlet, but brighter and better shape; *Hermione*, a very fine white; and *Miss*

*Joliffe*, pale pink. The plants of these Carnations were beautifully grown, stout, bushy, and calculated to produce a full crop of flowers. *T. Baines*.

(To be continued.)

CYCADS.

WE are induced to reproduce a figure of the male spike of the *Encephalartos villosus* which we published some time since, in order the more forcibly to contrast it with a noble spike now before us from Mr. Rann, gardener to C. Warren, Esq., Handcross Park, Crawley. Our illustration was two-thirds the size of Nature; but even making allowance for the diminished size, the original could not have com-

FIG. 35.—MALE CONE OF ENCEPHALARTOS VILLOSUS.

peted with the glorious spike grown by Mr. Rann. This spike, which in all points except size resembles closely the one figured, measures no less than 26 inches in length by 10 inches in circumference at the broadest portion. The colour is a delicate apple-green suffused with a pale glaucous bloom, and the perfume emitted is particularly delicate. The under surface of the scales is covered with yellowish anthers. It is indeed astonishing that these noble plants are so little grown in this country. Their great size and weight certainly offer objections in some cases; but those who complain of the monotony of their appearance forget the very charming appearance the plants present when throwing up the young foliage, and the truly noble aspect of the plants when producing their spikes or cones. We understand that it is Mr. Rann's intention to exhibit this spike at South Kensington on Tuesday next.

Home Correspondence.

Art in the Conservatory.—I have to thank you for publishing my paper on "Art in the Conservatory and Greenhouse," and can but be glad should its publication call forth some discussion among your practical readers, as my desire in writing the lecture was to acquire information as well as to give it, and I am fully alive to the fact that by publishing a technical paper in the *Gardeners' Chronicle* I have laid myself open to the critical remarks of some of the leading horticulturists of the day. Undoubtedly a glasshouse of whatever kind should first of all be built in the interests of the gardener and his plants, but beyond this I would go, and urge that in most cases the houses themselves can, with a little thought and trouble, be made good-looking, and in some sense, at any rate, architecturally correct, whether they are simply wooden or more monumental erections. Your correspondent, Mr. A. D. Mackenzie, to use his own words, "has been labouring under a mistake" in directing attention to my remarks upon vineries. His mistake is evidently due to the fact that he had read only some disjointed extracts from my lecture which were published in a gardening contemporary; indeed, that portion of my remarks referring to vineries was given only in last week's issue of your journal, to which I beg to refer your correspondent. He will there see that I said "for early vineries a half-span or rather lean-to structure is the best form of building, and that it should face the south, running east and west so as to have the benefit of the sunlight from morning to the evening." Then to show further that this was entirely my meaning, I would further refer to p. 106 *Gardeners' Chronicle*, January 24, 1880, the second line from the top. In my general remarks I said, "a span-roof house should be placed with the ends north and south, as by this means each side secure an equal amount of sun." Thus it will be seen that Mr. Mackenzie's concluding satirical thrust at me about teaching practical gardeners, &c., is unfounded; and I think the same may be said in the charge which he brings against me of doing "scant justice to other architects and horticultural builders," who have done much in the way of improving the appearance of conservatories. I clearly expressed my desire not to overlook such work, but it is equally evident that in so short a paper I could not enumerate a series or describe more buildings than I did. As to the rule which I gave for obtaining the proper quantity of piping to warm conservatories, I have only to say that it depends entirely upon the difference between the inside and outside temperature. Mr. Mackenzie makes this 70°, taking the outside temperatures as zero, but this, I take it, is unnecessarily low, as we do not get so low a temperature once in ten years, if so often. Taking the external temperature

At 26°	the result is 235 feet of 4-inch pipe
" 24°	" 207 " " "
" 22°	" 179 " " "
" 20°	" 151 " " "

while by the simpler rule I gave you get 270 feet, and for all practical wants this is sufficient, and 26° is low enough for ordinary calculations. Of course if any one is willing to pay for more pipe it can easily be arranged by taking a very low outside temperature. I have not relied entirely on my own knowledge in the matter of heating arrangements and in calculating for them, but have availed myself of the experienced assistance of a well-known horticultural engineer, Mr. Walter C. Burden, of Loughborough. There can be no doubt that a simple formula in plain figures, more simple than Hood's or any other that I know, is a want that very many people experience. The following query by a friend of mine was published in the *English Mechanic* last October, and as yet it has received no answer. I ask you to repeat it, as it gives my friend's rule, and some of your mathematical correspondents may be able to answer his query—"Can any one simplify this process, and put it in the usual shape? It is for finding the length of piping required for greenhouses. Multiply the glass or exposed superficies in feet by eleven times the required difference between the outside and inside temperature, and divide the product by fifteen times the intended difference between the temperature of the water and the air of the house. The outside air is to be taken at 32°, and the water at 180° Fahr." Surely this can be simplified, when no doubt it would be useful to your readers and *Maurice B. Adams, A.R.I.B.A.*

—In reading what has appeared on this subject one cannot help wishing that some of the designers or builders of such structures could

have profited by the remarks and borrowed a wrinkle or two, as in the majority of cases conservatories are mere prison-houses for plants, and ill-adapted for the purpose required. Architects, as a rule, know little or nothing of vegetable life; they are great believers in bricks and mortar, stucco, and such-like ornamentation, but as to light and its need for the successful cultivation of plants that is largely ignored; and hence it is that we see the dungeons that are frequently to be met with connected with mansions. What I should like to see is several conservatories to every house in the form of bay windows, instead of having dwellings as they now are, mere boxes with rectangular holes cut in the walls, through which no one can see out except straight ahead. By having projecting windows the vision can be carried in any direction and rooms made tenfold more pleasant, the spaces so created being just the places for standing plants, which when so situated afford a daily feast of beauty unattainable in any other way. It is only those living in towns that know the joys derived from the window culture of flowers, and with better arrangements provided for them they might be had in every home. People attach great value to pictures and pay high prices for their possession, but once seen they are always the same, while in plants there are continual changes going on to watch, and much to instruct us in our daily intercourse with them. That the love of plants is fast extending there can be no question, and it only remains for those who design our residences to break away from the monotonous style now so prevalent, and make them, not only fit habitations for man, but such that he may associate with the beauties of Nature. That this may be done any one can see where there is any departure from the old fashion, a striking instance of which I have recently met with, where a sort of double conservatory, one on each side, forms part of the house. In these plants flourish, and the song of birds is heard among them, the two combined lending such a charm as to make life pleasant within. *J. S.*

—With reference to Mr. Adams' recent article in your paper will you allow me, in hopes of receiving some practical suggestions, briefly to describe a conservatory, architecturally a success, but horticulturally a failure? In shape it forms five sides of an octagon, and faces the south; the floor is 3 feet below the house-floor level, to which four steps lead to the door communicating; it is 14 feet wide by 12 feet long; front height 6 feet, with roof span of 7½ feet. It is glazed with clear glass except on the roof, most of which is obscured. It is ventilated at the bottom by four opening sashes, each 2 feet by 1 foot; and at top by opening sash on roof, 3 feet by 1 foot. There is staging round about, with border underneath planted with Ferns, and cement water-tank, 6 feet by 3 feet, in north corner, to grow aquatic plants. It is heated with gas, and provision is made to carry off any escape. The plants growing are greenhouse, stove, and florists' flowers, and none of them do well when taken into it, but go back every day; some lose their leaves, others drop their flowers, particularly Fuchsias and Acacias. Foliage plants stand best, but they, too, suffer. *S.* [The gas-heating is probably at fault; but in any case such a house is not a proper one for the cultivation of small plants. *Eds.*]

*Adiantum fulvum*.—My experience quite agrees with Mr. Walker's (p. 119) regarding this Fern. The name is frequently given in nursery catalogues, and I have more than once ordered it, but never received Raoul's plant. I believe it is not in cultivation in this country. Another species of *Adiantum* also requires correction. That is *A. glaucophyllum*. In almost every nursery catalogue the name appears, but any plants I have seen seem to be a small variety of our native *Adiantum*, which may be called *A. Capillus-Veneris minus*. Where this originally came from I am not aware. The true *glaucophyllum* of Hooker is a Mexican plant somewhat resembling cuneatum, but of a firmer texture and glaucous in the pinnules, as its name implies. Probably it, too, has yet to be imported. *P. Neill Fraser, Rockville, Murrayfield, Edinburgh.*

*Humea elegans*.—This graceful biennial, in addition to its beauty as a summer decorative plant for outdoor purposes, is also well adapted for the embellishment of the greenhouse and conservatory. On the first appearance of frost here last autumn several of the best plants were selected and transferred to a cool conservatory, and they have up to the present time continued to give a graceful and elegant effect intermixed with other plants, and to all appearance are likely to continue good for another month or longer. The flowers are also most useful when cut for mixing with other cut flowers for table decoration, lasting, as they do, for a considerable time. Seed sowed now (although I prefer autumn sowing) and kept growing on in a brisk heat would make nice plants for late summer and winter decoration. Being a strong and fast growing plant it requires plenty of pot-room when in a young state. *Thomas Carlton, The Gardens, Wilderness Park, Sevenoaks.*

*Sternbergia lutea*.—There can be no doubt but that this pretty little Amaryllid is strictly autumn-flowering. Yet it does occasionally appear to reserve its beauty till the gloom of winter prevails and enhances it by contrast. I have seen patches of it in the same garden blooming under a wall in early September, while not far off the same spot but growing close to the Box edging in a herbaceous border, it might be seen flowering a couple of months later. The fact is, like everything else, this little bulb is accelerated or retarded in its growth, and consequently in flowering also, by circumstances, and the apparent anomaly which your correspondent "A." draws attention to may be due entirely to the defective ripening of last summer's growth. The plants may possibly not have been at rest at all, as is often the case with bulbs after a season like last summer, and may have been excited into premature activity by the mild weather that closed the old and ushered in the new year. But did "A.'s" plants not bloom last autumn, or has he not been accustomed to see them in flower at that season of the year? If he or "J. S." has a form that persistently and invariably blooms in spring, I should like to hear more about it. *Wm. Sutherland, Craigleith Nurseries, Edinburgh.*

*Eucalyptus globulus*.—In addition to the other extraordinary virtues that have been ascribed to the above-named plant, it appears that a fresh one has been discovered, for, according to an Italian medical paper, R. Rudolfi, a doctor, reports as follows:—Being seized with a coryza (sneezing fit), he happened to chew one or two twigs of the *Eucalyptus*, at the same time swallowing the saliva secreted, which had a bitter and aromatic flavour. To his surprise he found that in the course of half an hour the nasal catarrh had disappeared. Some days later he was seized with another attack from fresh exposure, when the same treatment was followed by an equally fortunate result. He then prescribed the remedy to several of his patients, all of whom were benefited in the same way. In making this known, it is to be hoped there will not be a fresh craze about this wonderful plant, which at one time was so exalted as a preventive of fever, which many thought from its use was to be banished from certain spots. Apart from all this, it is a great pity that the tree is not hardy enough to stand our climate, as from its quick growth and glaucous, silvery foliage, it would form a fine ornament in parks or pleasure-grounds associated with others of a darker hue. The past severe winters, however, have proved how useless it is to plant it, as they have succumbed everywhere to the inclemency of the weather. There are, I believe, other varieties under trial that may prove sufficiently hardy, and if any of these possess the same qualities that are said to attach to *E. globulus*, what a boon they will be to us Englishmen, who, from fogs and sudden changes, are coughing and sneezing a good part of our time. *J. Sheppard.*

Double Chinese Primulas.—Your correspondent "N." (p. 116) has not by any means over-estimated the merits of these plants. I know of no other class of plants so useful for winter flowering purposes. Provided some of the best kinds are obtained and liberally cultivated, their flowers will rival Carnations in size and beauty, and they will be produced in abundance all the winter if kept in a dry temperature, ranging from 40° to 50°. I would not advise any one who intends to commence their cultivation to depend on the seed offered as double by seedsmen. I find it generally ends in disappointment and vexation, producing after six months' care and attention principally semi-double flowers, which seed again and consequently are not to be compared with the real double kinds in any way, especially as regards their lasting properties when cut for vases, &c. By far the best way is to obtain a selection of named varieties and propagate them afterwards in the usual way. *W. H. Divers, Buryhley.*

Another Rose Stock Pruner.—The plan followed here for seven or eight years past has been to simply harness a strong pair of scalders, nippers, or grippers as they are called in some places—the people here call them *quiltines*—to a bench by means of two strong leather straps. The principle is precisely the same as shown in the patent instrument recently figured, and it is quite astonishing the power that can be exercised by their means: anything in the shape of a Brier can be quite easily trimmed. The additional merit you claim for Messrs. Laing's instrument, that it can be used for other purposes, applies with much greater force to this much more simple instrument; in fact, it can be used in many cases where it would be quite impossible to use the other; and where such a simple arrangement is possible, and one, moreover, capable of accomplishing all that is required, there is surely no necessity to spend money on a French invention of less utility. *T. Smith, Newry.*

Bees in the Peach-house.—Like Mr. Miller we have bees in the Peach-house, and right busy they

are, with the best results, viz., the fertilisation of the blossom. I strongly believe in keeping bees in the garden for that purpose, and apart from the fact that they are interesting creatures, their industry is proverbial, and the person who watches their movements must be dull indeed if he does not learn a lesson therefrom. It is quite possible to make their acquaintance. I have my bee-house right in the midst of the forcing houses, and a few Orange trees placed round them afford a sure place for the queen to rest in when they swarm, and by placing them near the young men's rooms a swarm is never lost. Last year was the worst for bees that I have ever known, and I warn all keepers of them that they must be fed, and promptly too, or else they will starve. A few shillings spent during this and the next month, will be repaid twentytimes before next August. We encourage the labourers here to keep bees, and give prizes at the cottagers' show held alternately here and at Bayham Abbey, always giving the preference to those who do not destroy their bees, and although I own that in most of our bee books their profits are set rather too high, still it is surprising what they will do in a fine summer. *J. Rust, Eridge Castle.*

The Uprooting of Conifers.—The loss of such trees as the *Arucaria imbricata* and *Abies nobilis* at Keir is deplorable, and every means should be taken to prevent further loss if possible. The coniferous trees are not generally deep-rooted; we have lost many fine Spruce trees from being uprooted with the wind, and on examination I have found all the roots within about 15 inches of the surface in a perfect mass; consequently trees with such a weight of foliage must give way before the wind sooner or later. After taking particular notice of the fall of the Spruce trees, I became alarmed for the safety of a few handsome trees, one in particular, a noble specimen of *Abies nobilis*, which stood very much exposed to the north-west gales. On the roots of this tree I put twelve good cartloads of soil, which raised the surface about 12 or 15 inches up the stem of the tree, sloping gradually away some distance beyond the extended branches. It rather improved the appearance of the tree than otherwise. This was done about eight years since: the soil is now full of roots, and the tree appears as firm in the ground as a tower. If so little labour would save such fine trees as those which, I fear, have been lost, would it not be wise to do it? I should add that the tree has made wonderful growth every year since the soil was put on, on three occasions making a leading shoot quite a yard in length. *William Culverwell, Thorpe Perrow.*

Hardy Primulas Wintering.—In his notes upon "Florists' Flowers," at p. 141, Mr. Douglas alludes to several hardy Primulas in words that may well lead those unacquainted with their habits to believe that they are really not so hardy as generally esteemed. Mr. Douglas says: "Some species of Primula in the same frames as the Auriculas have not wintered quite so well; of these may be named *P. sikkimensis*, *P. purpurea*, *P. cashmiriana*, and *P. capitata*. The newly-introduced *P. rosea* lost all the old leaves, but the crowns are sound. *P. Parryi*, a rare species, also lost all the old leaves, but it has a sound centre to start from." Now every kind named is strictly herbaceous, just as much as the *P. amœna*, all of the varieties of which are as hardy as any border plants we have. *P. sikkimensis* is, perhaps, of all the family the most deceptive, as it lies dormant and crownless through the winter, considerably below the surface of the soil; it is almost semi-aquatic in habit, and as its home is some 17,000 feet high on the Himalayan slopes, we need not fear its capacity to withstand our frosts; it is not so easy to keep it well through the summer heats. *P. purpurea* and its ally *P. denticulata* are here in the open ground, with the dead foliage of last year lying all around the crowns, already throwing up new leafage and heads of bloom, literally enjoying and laughing at the frosts. No hard weather hurts them. *P. cashmiriana* in pots, where no frost has reached, is as leafless as are those growing in pots in a cold frame, and the same may be said of *P. rosea*. *P. capitata* is equally deciduous. *A. D.*

*Justicia flavicoma*.—There is generally a great scarcity of yellow flowers, and in winter quite a dearth of that colour exists, for excepting this *Justicia*, the good old *Coronilla glauca* and *Linum trigynum*, there are none to be had at that season. Although *Justicia flavicoma* is by no means new, it is very rarely met with in stoves, which, considering its very showy character and remarkably free flowering habit, is rather surprising, the more so when one considers how exceedingly useful it is to associate with *Serico-graphis*, *Euphorbias*, &c., with the scarlet of which the soft canary of the *Justicia* shows up in fine contrast. With us it is one of the staple plants grown, as it can always be depended on to yield a supply of flowers for cutting, and having small vases to furnish it comes in admirably for that purpose, for even those in 3 or 4 inch pots carry several heads of bloom, which, if the plants are in a nice warm

position, last a long time in perfection. If these are wanted of large size, the cuttings should be put in early, and as soon as struck potted off and nursed on in a moist atmosphere, where they can enjoy a temperature ranging from 60° to 75° or so, and be stood near the glass so as to induce a dwarf bushy habit. To aid them in forming this it is necessary to nip out the point of the main shoot, and after the end of May it will be found that the plants will do much the best plunged in a bed of gently fermenting leaves or tan in a cold frame, where with others of a kindred nature they can be syringed and closed early in the afternoon to expedite their growth. By the end of September this will be complete, and the thing then is to remove them to a light house where they can have full exposure to ripen up the shoots, from the tips of which the heads of bloom are emitted. After flowering, the greater part may be thrown away, as fresh struck plants are generally the most vigorous, but if any of extra size are required they may be had by keeping a few of the old ones and cutting them partly back, and when they break again they should be shaken out of the old soil and repotted, to be afterwards grown on in the same way as the others. A mixture of peat and loam, or the latter and plenty of leaf-mould, is the most suitable to grow them in, to keep which open a sprinkling of silver-sand is necessary as well as free drainage below. Except greenfly, insects seldom trouble *Justicia flavicomis*, and these are easily despatched by the ordinary means of fumigation, which should be carried out as soon as they put in an appearance. *J. S.*

**Select Vegetables** (see p. 119).—Vicks' Criterion Tomato is certainly one of the best varieties as far as the quantity of fruit which it produces is concerned, and also for its quickness in coming to maturity, but for quality it is not to be compared with either Hathaway's Excelsior or Stamfordian, which contain a much greater amount of flesh in proportion to seeds and water. I am acquainted with several fruiterers who could not sell Vicks' Criterion last season while either of the above were obtainable. *W. H. Divers, Burghley.*

**Primula farinosa.**—Without disputing the correctness of Mr. Dod's observations of the habit of this pretty Primrose, I may venture to record my own experience of it in other localities, showing that it is much more accommodating to varied influences than is usually supposed. Between Geneva and Chamounix it may be seen growing in abundance in situations answering to Mr. Dod's localities, excepting that of elevation; while in the West of Yorkshire, called the Craven District, which is limestone, it is common up many of the "gells," and in moist situations, growing at an elevation of from 600 feet or 1000 feet above the sea-level. Occasionally I have heard the country people attribute to this Primrose the property of causing blindness to those who too freely inhale its perfume. Though in a wild state, and confined to a limestone soil, *farinosa* thrives in an ordinary border when it is not exposed to too much sunshine; in such a situation its head of flowers becomes almost globular. A root of this Primrose, that I grew in a damp shady border, was viviparous, producing a young plant on a withered whorl of flowers. *A. Clapham, Scarborough, Feb. 3.*

**Strawberries.**—Your correspondent, Mr. Ravenhill, at p. 120, speaks of having gathered last year 17 lb. of Strawberries from thirty-eight plants. As I consider this an extraordinary crop I should like to ask him whether they were grown in the usual 6-inch pots, and also whether the number specified were an ordinary batch, or a few selected, after the fruit were set, from a larger quantity of plants? If these two questions can be answered in the affirmative, I shall, as one much interested in Strawberry growing, be extremely obliged to your correspondent if he will favour me, through your columns, with a few details of his treatment. *A. G. Bridgeman, Thames Bank, Marlow.*

**Outgrowth from the Roots of Ash.**—The sketch I send is a rough representation of a peculiar tuber-like growth upon the root of an Ash. The swelling terminates the root, is 5 inches in its longest measurement and 4 inches at its broadest, of a flattish shape, and weighs 11 oz. No rootlets protrude from it, and it is of a hard woody texture. How has it been caused? [Possibly by some obstacle to downward growth. Eds.] *John Wilson, St. Leonard's Gardens, St. Andrews, Feb. 2.*

**Orchards for Farms.**—The present depressed state of the agricultural interest, the cause of which is now under the investigation of a commission of enquiry, suggests some remarks. Labour forms a heavy item, as also the expenditure for beer, excepting in a few districts where cider is grown. The growth of Apples and Pears to any extent is confined to a few districts, although there is a good market in all our principal towns; so much so, that immense quantities are annually imported from

America, France, and other countries. I would suggest to landed proprietors that they would improve their estates and benefit their tenantry by planting orchards with a good selection of Apples and Pears suitable for market and cider. In the cider districts it is preferred by the labourer before beer, being more cooling. The expense of manufacture would not exceed 3/4 per gallon, and it would keep for years if properly made. The small fruit would do for that purpose, and selected fruits would find a ready market at good prices. By selecting a grazing field as near the homestead as possible, and planting good standard trees at such a distance apart as to affect but little the grazing or mowing in a few years the farmer would be much benefited in having fruit for domestic and marketable purposes, and would be relieved of the heavy expenditure—which he cannot avoid—in beer. At present, when the attention of landed proprietors is drawn to the most efficient mode of benefiting the tenantry, I beg to offer the above suggestion for consideration, and, if entertained, I should be happy to give any information as to the kinds of fruits most suitable for the purpose. *John Paterson, 11, Faulkner Street, Bishop's Fields, Chester.*

**How Have Grapes Kept?**—It would be interesting to know how Grapes in bottles have kept so far, this being an exceptional season. I have at the present time between seventy and eighty bunches of Grapes left, after a daily supply since May, of the following varieties:—Lady Downe's, Black Alicante, Muscat of Alexandria, Gros Colmar, and a few Muscat Hamburgs, with Mrs. Pince. They are not keeping with me so well as last year, or in fact so well as they have done for the last twelve years. The bunches go mouldy, first at the shoulder, and then through the centre of the bunch, whilst the berries are as sound and firm as when first cut from the Vine. I sent in a bunch weighing 1 lb. 14 oz. of Gros Colmar on Sunday as perfect in bunch and berry as it was possible, with a very fine bloom, for dessert, and I have others left from the same Vine, cut at the same time, that I have been compelled to cut half away. I commence cutting for bottling in November, and continue at intervals until the end of December, never having found any benefit accrue either to the Grapes or the Vine by leaving them on later than the latter month. I may mention that frost has been entirely excluded by means only of a paraffin lamp, and we are possessed here of as perfect a fruit-house and Grape-room as it is possible to build. *J. C. Mundell, Moor Park Gardens.*

**Camellia Duke of Lancaster.**—I send for your inspection two blooms of one of the varieties of *Camellia* illustrated in your recent plate, viz., Duke of Lancaster. It is a seedling raised by a gentleman in this neighbourhood from Red Waratah. I purchased the stock thirty-five or forty years ago, and named it Duke of Lancaster. Messrs. Loddiges, Hugh Low & Co., Rollisson, Henderson, and others were all purchasers of it at that time. I submitted the bloom to Dr. Lindley, who gave a very favourable opinion of it, but pointed out its great fault, viz., the deep cut in the petals, which it undoubtedly has. I have the original plant in my possession at this time. *Richard S. Yates, Sale, Cheshire, Feb. 3.*

**Brussels Sprouts.**—With regard to the failure of Brussels Sprouts spoken of by Mr. Fish and other correspondents lately, it may be of some advantage, by way of solving the problem, to state that the plants which I found here never produced a single Sprout. The seeds were obtained (not by me) from a firm of unblemished reputation, and were sown in good time, carefully pricked off, and finally planted out on an open rich piece of ground, with the result above mentioned. Being the possessor of a Sprout of my own, and having greater faith in old and well-tried friends than in new ones, however fine their appearance may be, until I have "proved" them, I planted out an equal quantity side by side of both sorts, my own variety being so late that I entertained small hope of them turning out to be much, only I knew I could depend upon them sprouting. Had I not taken this precaution I should have been like Mr. Fish—without a single dish of Sprouts this winter. I exhibited a fair sample of the crop at one of the meetings of the Royal Horticultural Society last November, and although the seeds were sown later in the season and the plants not cared for in a young state, the crop was in every way satisfactory. I am aware I am treading upon delicate ground, and that the Editors have attributed the cause of failure to the arrested development of the plants owing to the past untoward season. I am of opinion that plants raised from "imported" seed lacked constitution to pass the ordeal of last summer, and I am sure the Editors will be pleased to publish any information that is calculated to render assistance to cultivators for the present season. *W. Hinds.*

— I think I may consider myself one of

the favoured few in having a good supply of greens, and particularly of Brussels Sprouts. In a general way Brussels Sprouts cannot be sown too early in the year, indeed my best have been those which were sown in heated pits between the rows of Potatoes on November 30, 1878, and pricked off into boxes, then gradually hardened off, and planted out in well-prepared ground in the first week in April. Gathering commenced fully on November 5, 1879, and since that date we have sent into the house over 8 bushels, irrespective of other kinds of greens, Cabbage, Savoys, &c. I have at the present time plants ready for pricking off, which were sown on December 12; but I do not confine myself altogether to the early sown plants for a late supply, as I make successional sowings up to the end of February, but the latter are not so fine as the earliest. I grow the imported Brussels Sprouts, and Scrynggeour's Giant: the latter is by far the best. *J. C. Mundell, Moor Park Gardens.*

**White Scale on Pines.**—It is generally considered a most difficult task to rid Pines of white scale when they are once overrun with it, and I had formed an idea—and not without ground for doing so—that it was almost, if not quite, an impossibility; but I am now inclined to think my idea is erroneous, for I notice that a correspondent has been advised to try paraffin as a remedy. Is this an effectual remedy? If so, I am sure others besides myself will be glad to know, for it would be a simple way of eradicating the most formidable and destructive insect, excepting perhaps the Phylloxera, with which the indoor fruit grower has to contend. Happily our Pines are now clean, or I should give it a trial. On coming here I found a collection infested with this troublesome pest, with which I at once waged war, and after battling with it without success for over two years by trying various things which have at different times been recommended, including hot fermenting dung, as mentioned by you, and soot, and flowers of sulphur, as adopted by the late Mr. Tillery, of Welbeck, and quoted by Mr. D. Thomson in his excellent *Treatise on the Pine-apple*—also spirits of wine mixed with certain chemicals, the names of which I have now forgotten—we gave up the thought of cleaning them as hopeless; so after having secured from friends a stock of clean suckers and established them in a compartment devoted to themselves, the old stock was destroyed and the houses thoroughly cleaned. This is a certain and inexpensive way of exterminating white scale, but all are not favoured in having friends who have clean suckers to spare; therefore, if success can be attained by using paraffin it cannot be too widely known. *T. Coomber.*

**"Acme Labels."**—These labels have so many good points to recommend them, that they will doubtless soon become an "institution" in the gardening world. Being made of zinc, they are practically everlasting; while the letters being stamped in fine, bold type, and raised or embossed, there is no limit to their legibility. Where the name consists of two words, or lines, the type shows to best advantage, as it fills up the space. I think it would be an improvement to use a larger type for short names, particularly on the fruit-tree labels, such as Elton, Victoria, Dr. Hogg, Noblesse, and such-like—the type now in use showing to best advantage in such names as Baroness Rothschild, Duchesse d'Angoulême, &c. A great advantage may be claimed for these labels in the fact that while they are so distinct as to be easily read at some little distance, they are not so conspicuous in the aggregate as to form a disagreeable feature in a collection. If wanted they are easily found, while if not wanted they attract no attention. It often happens that a few hundreds of white painted labels are a disagreeable feature in a garden, being sometimes much more conspicuous than the plants whose names they bear. *D. Melville, Dunrobin Gardens.*

**Fungoid Diseases.**—Is it a fact or a mere assumption, that just as great epidemics have declined amongst the human race they have increased in both the animal and vegetable worlds? Science has been so largely exercised in the direction of health improvement amongst men that great physical calamities produced by direct violations of the laws of Nature are rare occurrences. Plagues, fevers, small-pox, cholera, epidemics of all kinds, now create comparatively little alarm or little cause for it. Sanitary knowledge and practice have robbed them of their terrors and powers, and for all the ill they can accomplish men perhaps breathe more freely and more healthily now than at any time since the days of Adam. But what man has in that direction gained has been lost in others. In the animal world pleuro-pneumonia and cattle plague; amongst the denizens of our rivers, the destructive salmon fungus; amongst vegetable life, the deadly diseases that affect the Vine, the Potato fungus, the Hollyhock disease, and many others all of comparatively modern origin, seem to have sprung into existence to plague the lower world just in proportion to man's

emancipation from epidemic diseases. In dealing with diseases in the lower forms of animal life, and in the vegetable world, the absence of intelligence interposes serious obstacles to any sanitary efforts, just as in times past gross ignorance on the part of portions of the human race prevented the introduction of those great reforms that time has at last brought about. Our rivers have been so long the nation's open sewers that it is no wonder fungoid diseases are rife, the only present cure for which seems to be found in the freedom and purity of the open sea. The cattle plague has doubtless sprung from the long keeping and production of cattle under conditions that are too artificial. Perhaps the prevalence of vegetable diseases is to be explained in a similar way. If we have purified the atmosphere for the benefit of man's health, we must look in a similar direction for other good results for the behoof of the vegetable kingdom. V. [Without endorsing the ideas thrown out in this note, we may yet point out that sanitary science is, so far as it regards the prevention of human maladies, thanks to the doctors, much more in advance than in the case of plants. Because they cannot hope to save all their Potatoes by any means yet known, cultivators still fold their arms and do nothing, waiting till a disease-proof Potato is sent from Heaven for their benefit. Eds.]

**Azalea ledifolia** var.—A few words on an Azalea shown under my name at the last Horticultural Society's show, and noticed by you, may interest some of your readers. It is an Azalea of the indica type, with double or semi-double lilac flowers. Twenty years ago a large bush of it was growing in my garden, side by side with *A. alba indica*, and bloomed out-of-doors equally and excellently well. The large plant was moved for some alterations, and died; but some cuttings had been taken, of which the plant exhibited is the survivor in my garden, the others having been from time to time given away. This plant has, I may say, from early youth till last October always grown outside, without any protection, and appeared at the show in this wise. It was mentioned by chance to Mr. Taylor, the experienced foreman at Messrs. Veitch's, and he asked to see the blossom, and recognised an old and, as he fancied, a lost favourite. Thereupon the plant was dug up and sent to Chelsea, to be dealt with as thought fit. Mr. Taylor named it from memory, I believe; but on referring to the *Botanical Magazine*, pl. 2599, I think it is undoubtedly the *Azalea indica* var. *β plena*, there figured, which, later on, is suggested to be a variety of *A. ledifolia*. The interest lies in the undoubted hardiness of the plant, and perhaps in its being an old introduction lost. I have seen it nowhere else, nor Mr. Taylor, for many years. Perhaps some of your readers can give further particulars. J. H. Mangles, Valewood, Haslemere.

**Aucuba superba**.—In your last number reference is made to *Aucuba superba*, which induces me to offer a brief explanation how it with many other promising seedlings was raised. When Fortune introduced new and choice varieties of this valuable shrub, it became evident to the hybridist that a new and extensive field was opened for the practice of his art, and that time and patience were the only requisites to ensure success. Entertaining these views, an early opportunity was taken to secure *picta bicolor*, *salicifolia*, *longifolia variegata*, *longifolia aurea variegata* and *limbata*, the two former proved to be worse than useless, their pollen producing a large proportion of green seedlings, and no blotched ones: the other four varieties being females, an extra amount of labour was required to produce maculated *salicifolia*, male varieties of *longifolia variegata*, and broad-leaved variegatas. This will be understood when it is stated that after ten years' careful hybridising only about eighteen variegated plants were raised out of some 4000 berries, but besides these all the other desired properties have been obtained; and now that pollen from them will soon be abundant it is to be hoped that *Aucubas* of equal beauty to *superba* may ere long be easily attainable. The variegated lines noticed on this variety are common to all variegated *Aucubas*, and if these lines are traced upwards they will be found to be the source of variegation. Maculated plants exhibit dapples or occasionally a light yellow stem, which indicate increased colour in the foliage; the male plant of *superba* (which was raised from a different plant to that of a female of the same name) will explain these remarks—some parts of the plant being prettily variegated, while others are dark green. If advantage is taken of these peculiarities a system of graft-hybridising may probably work great results; by grafting [?] inarching] a variegated or highly coloured scion on to a corresponding stock, an increase of either property will be secured. A proposed change of residence has induced me, most reluctantly, to relinquish a continuance of experiments in this direction, though I trust that those to whom I have given my entire collection will consider them of sufficient merit to deserve still further improvement. A. Clapham, Scarborough, Feb. 3.

## The Poultry Yard.

**WINTER LAYERS.**—There is probably more nonsense written about the getting a supply of hens' eggs in winter than concerning anything else associated with poultry. An old, though not very wise lady, once remarked "that she could not account for it, but it was the case—the fowls always left off laying when the eggs got dear." The old lady's experience is universal. Although hundreds of recipes have been given of food for hens to induce winter laying—although these have been enforced by hundreds of assertions and professed experiences—yet the winter supply of eggs remains as small as ever, as is shown by the fact that new-laid ones fetch in the London district 2½d. to 3d. each. The great panacea, in the estimation of would-be egg-forcers is feeding; and the diet advised invariably is of a stimulating and forcing character; but as far as experience has gone, one fails to find that forcing obtains more eggs than are secured where natural and simple conditions of diet are found. The cause of failure lies in the fact that we have no right to look for the performance of more work from fowls than from other species of the feathered family. Scarcely any other bird drops eggs in winter, not merely because it is not the natural season for the production of young, but also because cold is unfavourable to the development of the ovary. To feed liberally with a stimulating or heating diet is to force the internal system by artificial heat whilst the external conditions are directly counter to the production of the desired results. The process is about as sensible as it would be to force a vinery with the roof off. Far more practical than such a plan is it to house fowls in a genial temperature at all times during the cold season. If such a plan were practicable on a large scale, no doubt early pullets would, under the influence of the genial warmth, begin to lay several weeks earlier than they would if exposed to the winter's cold. If a large building were heated by hot water as a fowl-house, and the poultry confined to it during cold weather, no doubt it would pay in the long run, and be productive of much less permanent injury to the fowls than must inevitably follow when, by means of artificial feeding, it is attempted to force them to do that in January which Nature does not exact from them till March. A. D.

## Reports of Societies.

**Scottish Horticultural Association: Feb. 3.**—The ordinary monthly meeting of this Association was held at 5, St. Andrew Square, Edinburgh. There was a large attendance of members; the President, Mr. J. Dunn, occupied the chair. Mr. John Sadler, Curator, Royal Botanic Gardens, communicated some notes on the hybridising of *Fragaria lucida* with other species and varieties, by Charles J. Burnett, Esq., Aberdeen. He sent plants of Strawberries, the result of *Fragaria lucida* crossed with Carolina: they were plants of vigorous growth, with much of the evergreen constitution of its *lucida* parent. He had found it entirely untainted with mildew, even when mixed up with runners of Black Prince and other sorts, and at the same time it thrives well on hot soils. Mr. Sadler next described some of the flower badges used by the clans on battle days and high days. He exhibited dried specimens of the various plants, giving the names of the people who adopted them as their insignia, and concluded by promising to pursue the subject further on a future occasion. Mr. Sadler also gave a short lecture on the "Leaf," illustrated with diagrams. In some plants the petiole took the form of a leaf, and was not unfrequently confounded with it. Diagrams of the different shaped leaves were exhibited and explained, and their structure in every form was also illustrated, as well as their arrangement in different plants. The stomata and their use were referred to in detail, and the movement of leaves was shown in such plants as *Dionea Muscipula*, *Mimosa pudica*, *Drosera*, &c.

Mr. Wm. Burns, Thingwall Hall Gardens, Birkenhead, sent a paper on the "Pear," his remarks applying to the cultivation of this fruit in the northern part of Cheshire, where there is a hard, cold clay subsoil with a slight decline to the North. In regard to the influence of the stock on the scion, he had nothing farther to add than what he communicated to the previous meeting, when he exhibited the Pears which were figured in the *Gardeners' Chronicle* of January 10. The tree was an Aston Town, which did not bear, and he regrafted it with *Beurré Clairgeau*. It has now borne well for two years, and the old spurs of the Aston Town have borne also. The Editor of the

*Gardeners' Chronicle* had stated as a possibility that it was hybridised by the pollen from flowers of the Aston Town, but this would hardly be the case both years. If they are both in flower next year he will report to the meeting. [It would be well if leaves and flowers of stock and scion could be shown together for the purposes of comparison. Eds.]

Dr. Paterson, Bridge of Allan, exhibited Orchid blooms, which were much admired; Mr. R. Grieve, Falconhall, exhibited a large white flower of an Orchidaceous plant; J. Dickson & Co. exhibited *Lyrus Maulei*, *Scilla sibirica*, *Primula pulchella*, *Saxifraga Burseriana*, &c. Mr. Robertson Munro, Abercorn Nursery, exhibited two *Saxifragas* in flower. There was also on the table, in flower, *Acacia Ricciana* and *Clematis indivisa*. Mr. G. McKinlay, Tulloch Castle Gardens, exhibited a plan of a flower garden. The Council awarded a Cultural Certificate to Mr. A. McMillan, Broad Meadows, for the cultivation of Pelargoniums and Chrysanthemums; and a Cultural Certificate was also awarded to Dr. Paterson, Bridge of Allan, for the cultivation of the original white variety of *Odontoglossum Alexandræ*. It was intimated that the herbaria for competition by under gardeners, members of the Association, required to be sent to the Secretary, Mr. A. Milne, Leith Walk Nursery, Edinburgh, by the 21st inst.

**Meteorological: Jan. 21.**—The annual general meeting of this Society was held at the Institution of Civil Engineers, Mr. C. Greaves, President, in the chair. Dr. Tripe read the report of the Council for the year 1879, which showed that the Society was in a very satisfactory condition. Eighty-four new Fellows have been elected, and the total number at the end of the year was 473.

The great local differences in temperature and humidity require to be more accurately ascertained than they are at present, and this remark applies not only to seaside places, but also to inland districts in their relation to hills and valleys. It is with a view to obtaining better knowledge on this subject that the Council have instituted a new class of stations of a third order, to be termed "climatological," at which observations of temperature, humidity, cloud, and rainfall are taken daily at 9 A.M. only, with certified instruments, the thermometers being in Stevenson screens, so that the observations of temperature at the different stations may be strictly comparable. The total receipts for the year were £799 6s. 9d., and the expenditure £621 19s. 5d., leaving a balance in favour of the Society of £177 7s. 4d.

The President then delivered his address, in which he advocated a more attentive enquiry by the students of meteorology into the subject of hygrometry. The appearance and disappearance of moisture, its diffusion, its origin in and withdrawal from the vaporous form, were matters which could now be readily defined through the increased supply of good observations, especially those so widely circulated by the Meteorological Office, and those recorded by the observers of the Meteorological Society. In furtherance of this object he produced a digest of all the observations published by the Meteorological Office for the year 1879, a year of abundant moisture, and one which could hardly fail to afford traces of the constancy or inconstancy of beds of moisture, if they were permanent anywhere, or of their coming and going, viewed substantially as to their own existence, rather than as borne by the force of the winds, or acted on by the power of the air in its baric relations. The preparation of this digest from the hygrometric elements for 1879 proved such a laborious work that, being still incomplete and wanting the customary corrections from the various observatories, he refrained from comments and deductions, and gave the digest itself for the use of any students who might desire to work at the subject. The tables contained the calculated dew-point, vapour tension, relative humidity, and thermometric dryness throughout. These various and full data exhausted all the aspects of humidity in its vaporous state, and would supply means for a thorough study of the British climate in a year of maximum humidity.

## ROYAL HORTICULTURAL SOCIETY.

We have been favoured with the following "proof" of the annual report of the Council, to be read at the meeting on Tuesday next:—

The Council have to report to the Fellows a continuance of interest in the operations of the Society during the past year.

Notwithstanding the unfavourable weather which prevailed throughout the whole of last year, and which marred the success of the exhibitions and meetings generally, the receipts on account of these have not fallen greatly short of those of the previous year.

The fortnightly meetings have been liberally supported—groups of an interesting nature, and valuable collections of fruit, vegetables, and plants have contributed to sustain their high character; and the Council take this opportunity of acknowledging the valuable services rendered by the Scientific, Fruit, and Floral Committees, whose proceedings have been fully recorded in the *Journal* of the Society.

The great show of May 27 was equal to any former exhibition as regards merit and extent, and was honoured

by the presence of H.R.H. the Princess of Wales, and T.R.H. the Duke and Duchess of Edinburgh, the Crown Princes of Denmark and Sweden, the Count and Countess of Flanders, and the Duke of Teck.

The popular show upon Whit-Monday was an improvement upon that of the previous year, the Covent Garden growers filling the grand marquee with a brilliant display of the flowering plants which are specially grown for the supply of the London markets, and, in spite of the heavy rain, the number of visitors on this occasion was 8071.

The Council are desirous of fostering a love of horticulture amongst the humbler classes, and deeming this one of the objects to be kept in view by the Society they have resolved to hold a show upon Whit-Monday, May 17 next, and to postpone the competition for the cottagers' and artisans' prizes to the Bank Holiday, August 2.

In compliance with a desire expressed by the Fellows, the Council held a *conversazione* on the evening of Wednesday, May 28, which, in spite of the weather, was numerously attended. The tents of the great show and the conservatory were illuminated by different systems of electrical lighting, and the members of the Quekett Microscopical Club were present with their microscopes. The success of this *conversazione* encouraged the Council to hold an evening *fete* on July 9, the principal features of which were the exhibition of recent scientific inventions, including Edison's loud-speaking telephone, the phonograph, microscopes, with various other attractions. The gardens were brilliantly illuminated by electricity, and the attendance was very large.

Her Majesty's Commissioners for the Exhibition of 1851, having commenced legal proceedings in order to obtain immediate possession of the gardens, the Council were advised that they were bound to use every legal means of defending the interests of the debenture-holders, whose sole security for the payment of the interest on their bonds, as well as for the portion of the capital for which the property of the Commissioners was conditionally liable, would have disappeared with the termination of the lease to the Society. These proceedings are still pending. The Council cannot refrain from expressing their deep regret that the terms offered by the Commissioners some three years ago were declined by the debenture-holders—a refusal which not only involved the loss of an opportunity of obtaining repayment of a portion of their capital which might not easily recur, but has compelled the Society to embark in a litigation which they would gladly have avoided could they have done so with justice to the debenture-holders and with security to themselves. The Council have reason to believe that juster views of their position now prevail among the debenture-holders, and that if a similar offer were repeated it would be accepted by them. Such a course would be hailed by the Council with the greatest satisfaction. They cannot but think that, whatever may be the legal rights of the debenture-holders, strictly construed, their moral claim for considerate and even generous treatment by the Commissioners, on whose property their money was expended for objects warmly fostered by them and their late illustrious President, is very strong; while the amicable settlement of the question would greatly promote favourable arrangements by the Society with the Commissioners for the use of the gardens, or such portion of them, and of the adjoining premises, as would not be required for public purposes.

The fifth volume of the *Journal* has been completed during the past year. Amongst the papers may be mentioned notes by Dr. Masters, F.R.S., on "Root Hairs and Root Growth," and a treatise "On the Genus Tulipa," by H. J. Elwes, Esq. The reports of Chiswick trials have included Endives, Cabbages, double-flowered Ivy-leaved Pelargoniums, Abutilons, and Gloxinias.

The desire expressed by the Council in their last annual report, that correspondence should be opened with foreign and colonial horticulturists, has been gratified by the receipt of bulbs from Dr. Regel, of St. Petersburg, of many interesting Caucasian and Central Asian plants; and of seeds from various contributors at the Cape, in America, Australia, and Van Diemen's Land, seedlings from many of which will shortly be available for distribution amongst the Fellows.

The trials by the Fruit and Floral Committees at Chiswick have been continued as usual, but owing to the unfavourable season the results have not been so satisfactory as might have been desired, especially of those carried on in the open air. A complete trial of all the varieties of summer Radishes has been made, numbering 130 samples, a full report of which will be published in the Society's *Journal*.

The Society now possesses a fine collection of tuberous Begonias, many of which are hybrids raised in the gardens by Mr. Barron, who has also been most successful in raising several new and handsome varieties of the Chinese Primrose.

The violent hailstorm of August last broke upwards of 1000 panes of glass, while other necessary repairs at Chiswick have occasioned extra expenditure. The land on the west of the gardens having been sold and a new road made alongside, it was found necessary to erect a

new boundary wall. The cost has been defrayed by His Grace the Duke of Devonshire, on the understanding that one moiety shall remain as a loan to the Society at 5 per cent. interest. The expenses of the gardens have been reduced to a minimum, while their efficiency has been maintained under the superintendence of Mr. Barron.

One of the large boilers which heats the conservatory at South Kensington, and had been worked for many years, failed during the last winter: this caused, with fixing, an outlay of about £100.

Owing to the excessive and continuous rainfall during the past season, and the unusually low temperature which prevailed, the out-of-doors fruit crop has been very poor. Strawberries were most abundant, but literally rotted on the ground.

The crop of Grapes in the large conservatory was exceptionally good, realising about £400.

The young Vines planted on the long glazed wall have grown very strong and promise well.

A large number of plants growing in the rockery were killed by the severe frost of last winter, but most of them have been liberally replaced by Mr. Ware, of Tottenham, and others; but the damage done by the frost of the present winter may prove far more serious.

A list of the donors of plants, &c., is annexed to this report. The cordial thanks of the Council are tendered to them for their much-appreciated contributions.

Great attention has been paid during the past year to the distribution of plants and seeds amongst the Fellows of the Society. The number of plants distributed has amounted to 10,250; cuttings of plants, fruit trees, and Strawberry runners, 2300 bundles; packets of seeds, 44,730, being double the amount of the previous year.

The Council regret that, owing to the great scarcity of all kinds of seeds, caused by the wet and cold of the past autumn, the distribution during the coming season must necessarily be limited; but a very large stock of plants is being prepared, particulars of which, with form of application, will be furnished in the next number of the Society's *Journal*.

A new railway station on the Metropolitan and District Railway has recently been opened at Acton Green, within four minutes' walk of the garden. Trains run every half-hour. The entrance to the garden is now removed to Sutton Court Road, adjoining the Vestry Hall, Turnham Green.

The Council are glad to observe the continued success of the numerous Floricultural Societies which have been established in various parts of the kingdom, many of which have associated themselves with the Society, and report that, of all the prizes offered by them, the Society's Silver and Bronze Medals appear to be most appreciated.

The Council also note with satisfaction the progress which has been effected by associations which have taken various branches of floriculture under their especial care, such as the Rose, the Pelargonium, the Auricula, and the Carnation Societies, and some others. They will be glad to co-operate with such societies, and afford them all facilities for holding their various exhibitions in conjunction with the ordinary meetings of the Society.

During the past year 238 free monthly tickets have been issued to students in the Science and Art schools, with permission to sketch in the gardens and conservatory.

The Society has lost during the past year 47 Fellows by death, and 92 by resignation. 149 new Fellows have been elected during the year.

The roll of Fellows now consists of—  
837 Life Fellows.  
430 Fellows paying £4 4s. annually.

Variorum.

QUALITY OF FARMYARD MANURE. — A knowledge of chemistry and physiology is not needed to enable us to comprehend that the quality and quantity of dung voided by any description of fattening stock or milk-cows is the balance between the food consumed and that portion of it which is retained in their bodies as flesh, fat, &c., or withdrawn in the form of milk, perspiration, respiration, &c. The dung is therefore inferior to the food from a fertilising point of view, just in proportion to the substances extracted from the food by the animal economy; but it is improved in form as food for plants by having been consumed by animals—they prepare it for the plants, which in turn again prepare it for the animals. A 4-year old beast extracts from the food given him only those substances which go to increase the soft

portions of his body, and to maintain the various processes of which his life is made up; but a young beast not only does both these, but also extracts what is required for developing the bone; hence the dung of a mature animal is more valuable than that of a young one, just in proportion to the amount of matter which the young one keeps to build up the bony and muscular structure of his frame. It follows, consequently, that the quantity of manure produced on a farm will depend on the quantity of food grown and consumed on it, and on the quantity of feeding stuffs purchased to supplement and improve the food produced on the farm itself; and that the quality of the manure will in like manner depend on the kind of stock kept, and on the kind of food purchased in addition to that produced. *From "Dairy Farming," by Prof. Sheldon.*

**SOUTH AFRICAN TIMBER.**—The useful kinds of timber indigenous to South Africa number some hundred varieties, only a few of which, however, have hitherto been used for manufacturing purposes, and those only to a limited extent; and yet, although the forests cover an area of many thousand square miles, there are not wanting indications in certain districts of a falling off in the supply. The colonial authorities are fortunately taking steps to encourage tree-planting and forest conservation generally, and, at the same time, we are glad to see that they are not losing sight of the equally important question of at once utilising the natural wealth of the country. Hitherto the colony has imported not only her rails, but the sleepers also, instead of utilising some of the durable timber awaiting consumption within her borders. The principal South African forests are within a short distance of the shore; and as the denser part of the population is located round the coasts, and the railways are consequently confined to within a comparatively short distance from the seaboard, it would have seemed the natural course for the colonists to have utilised their native supplies of timber in their construction. The people, however, did not actually know the extent of their own possessions in this respect, and custom had probably a good deal to do with the maintenance of the system of "bringing coals to Newcastle," which has gone on so long. Now that the railways have thoroughly tapped the forest country, the utilisation of native timber will become more general, and more stringent laws for the preservation of the forests from further drain will be necessary. The cutting of timber and brushwood in the Crown forests is placed under strict surveillance, and licenses are required to be taken out by all persons cutting timber therein. The measures adopted for their preservation, however, are a heavy item in the expenditure of the Government; and the forests, instead of being a source of revenue, are actually a dead loss, costing £2500 in Cape Colony alone every year, and yielding only £2000. Many of the preserves, however, will bear largely thinning out; and with proper management, and new openings for the use of their produce, they ought rapidly to become a profitable property. *The Colonies and India.*

## The Weather.

Jan. 29.—Fine but gloomy and foggy in morning. Dull rest of day. Dense fog in evening. Fog cleared and sky cloudless at midnight. Painfully cold day.  
 — 30.—A very fine bright clear day. Bitterly cold in early morning. Quite warm in afternoon. Cold at night. A thaw.

Jan. 31.—A fine bright day, but very cold. Hoar frost in morning. Much fog at times, and more dense in some places than others.  
 Feb. 1.—Very cold and foggy morning. Sudden rise in temperature. Fine, mild, but damp till night, then cold. Foggy.  
 — 2.—A fine day. Cold in morning, mild after. Partially cloudy. Overcast at midnight. Some fog.  
 — 3.—A dull, cloudy day. Mild and damp. A damp mist fell in early morning.  
 — 4.—A fine day, but partially cloudy and cold. Hoar-frost and some fog in morning. Very dense fog at night.

NOTE.—The long-continued period of high barometer readings has now reached 127 days, viz., 1879, October 1—1880, February 4, inclusive. The mean reading for these 127 days is 30.067 inches, or 0.327 inch above the average. On many days together during this period the mean daily readings were between 0.6 inch and 0.7 inch in excess of their averages.

**LONDON: Barometer.**—During the week ending Saturday, January 31, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.33 inches at the beginning of the week to 30.19 inches by mid-day on the 25th; increased to 30.40 inches by the morning of the 27th, decreased to 30.20 inches by the morning of the 30th, and increased to 30.37 inches by the end of the week. The mean reading for the week at sea level was 30.29 inches, being 0.14 inch below that of the preceding week, and 0.34 inch above the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 50½° on the 30th, and 46½° on the 31st, to 28° on the 28th, and 30½° on the 29th; the mean value for the week was 36¾°. The lowest temperatures of the air during the week were as follows:—25th, 23°.3; 26th, 17°.5; 27th, 17°.9; 28th, 18°.4; 29th, 15°.3; 30th, 19°.8; 31st, 29°. the mean value for the week was 20°.1. The mean daily range of temperature in the week was 16¾°; the greatest range in the day being 30½°, on the 30th, and the least 9½°, on the 28th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Jan. 25, 28°.8, -9°; 26th, 25°.8, -12°.1; 27th, 25°.6, -12°.5; 28th, 22°.8, -15°.4; 29th, 23°.2, -15°.1; 30th, 36°.4, -2°; 31st, 36°.4, -2°.1. The mean temperature of the air for the week was 28°.4, being 9°.7 below the average of sixty years' observations, and 2°.7 below the value for the corresponding week in 1879.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 97° on the 30th, 78¾° on the 26th, and 73¼° on the 27th; on the 28th and 29th the readings did not rise above 48°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 12¾° on the 29th, 13° on the 26th, and 14° on the 27th. The mean of the seven lowest readings was 17°.

**Wind.**—The direction of the wind was E. and S.S.E., and its strength almost calm.

The weather during the week (with the exception of Friday and Saturday, on which days it was fine and somewhat mild) was generally dull, with much hoar-frost and painfully cold. Very dense fogs were prevalent, especially on the 27th, 29th, and 31st, on low grounds.

**Rain.**—No rain or snow fell.

**ENGLAND: Temperature.**—During the week ending Saturday, Jan. 31, the highest temperatures of the air observed by day were above 51° at Bristol, Cambridge, Liverpool, Sheffield and Bradford, and below 44° at Brighton and Wolverhampton; the mean value for the week from all stations was 49¼°. The lowest temperatures of the air observed by night were below 20° at Blackheath (London), Brighton, Bristol, Leicester, Cambridge, Norwich, Wolverhampton, Nottingham, and Liverpool; and above 25° at Truro and Sunderland; the mean value for the week from all places was 19¾°. The extreme range of temperature in the week was above 34° at Blackheath, Cambridge, and Sheffield, and below 25° at both Brighton and Hull; the mean range of temperature from all stations was 29¼°.

The mean of the seven high day temperatures was above 41° at Truro, Sheffield, and Sunderland, and below 36° at Wolverhampton and Nottingham; the general mean from all places was 38¾°. The mean of the seven low night temperatures was below 25° at Blackheath, Brighton, Bristol, Cambridge, Wolverhampton, and Nottingham, and above 31° at both Truro and Sunderland; the mean from all stations was 26°. The mean daily range of temperature in the week was above 16° at Blackheath and Cambridge, and below 11° at Wolverhampton and Sunderland; the mean daily range of temperature from all places was 12¾°.

The mean temperature of the air for the week from all stations was 32°, being ¼° higher than the value for the corresponding week in 1879. The mean temperature was above 35¼° at Truro, Sunderland, and Sheffield, and below 29° at Blackheath, Wolverhampton, and Nottingham.

**Rain.**—Very little rain was measured during the week. At Cambridge 0.02 inch was recorded, and at Plymouth and Nottingham both 0.01 inch. At most other places no rain or snow fell.

The weather during the first five days of the week was painfully cold, with severe frosts and dense fogs. On Friday and Saturday it was somewhat fine and bright, and the maximum temperatures at some places were between 51° and 56°.

**SCOTLAND: Temperature.**—During the week ending Saturday, January 31, the highest temperatures of the air observed by day varied from 50° at Glasgow, Paisley, and Perth, to 47° at Dundee; the mean value from all places was 48¼°. The lowest temperatures of the air observed by night varied from 25° at Leith and 25¼° at Edinburgh, to 34¼° at Paisley; the mean value from all stations was 29¼°. The mean range of temperature for the week from all places was 20°.

The mean temperature of the air for the week from all stations was 40¼°, being 8¾° higher than the value for the corresponding week in 1879, and 8¼° higher than that of England. The mean temperature was the highest at Paisley, 42¼°, and the lowest at Edinburgh and Dundee, both 39¼°.

**Rain.**—Rain or snow fell at Greenock to the amount of 2.70 inch, at Paisley 1.55 inch fell, and at Glasgow 0.99 inch fell, whilst at Aberdeen 0.02 inch only was measured. At Leith no rain or snow was recorded; the average amount over the country was 0.72 inch.

**DUBLIN.**—The highest temperature of the air was 52½°, the lowest 23°, the extreme range 29½°, the mean 41½°; and the amount of rain and snow 0.13 inch.

JAMES GLAISHER, F.R.S.

## Enquiries.

*He that questioneth much shall learn much.*—BACON.

**THE MANURING OF VINE BORDERS.**—Now that the time for washing and cleaning succession and late vineries has arrived, it would be instructive and interesting to many readers of the *Gardeners' Chronicle* to hear the opinion of some of its able correspondents regarding the manuring of vine borders. Some successful grape growers in the South of Scotland use no manure save the half-inch bones, and no liquid manure save frequent applications of guano-water. Now I consider the Vine requires more substantial manure than either of the above to bring to maturity a good crop of Grapes and strong vigorous wood. I think the above subject deserves the attention of some of our eminent English Grape growers. *Subordinate.*

## Answers to Correspondents.

**APPLE-TWIGS: E. W. S.** The specks on the young shoots must not be taken as the outward sign of disease. On the contrary, they are natural to a great many varieties, as we should have thought every nurseryman knew.

**ASPARAGUS: Chiswick.** The best way of making Asparagus beds on heavy soil is by the addition of lighter soil to it—or, in fact, making a bed of proper soil on the top of the existing heavy soil.

**BOTHY: H. H. C.** "The Bothy" is the commonly applied name of the apartments in a garden allotted for the residence of under gardeners.

**BRAKE OR BRACKEN FERN: Rochester.** The common Brake or Bracken Fern (*Pteris aquilina*) is by no means one of the easiest of Ferns to transplant. If you want to cover a good piece of ground, the best plan is to get a few cartloads of the roots from some neighbouring estate, dug up in large pieces, and plant them without breaking them up any more than can be helped.

**FUNGUS ON ROSE-LEAVES: Roseflora.** The name of the fungus is *Lecythis Rosæ*.

**HOLLY: J. H.** The narrow-leaved Holly, in which entire and spiny leaves are mixed up on the same branch, is the variety known as *Ilex Aquifolium doningtonensis*.

**HOLLY CUTTINGS: J. S. S.** These are planted in autumn, the ripened wood of the current season being selected for cuttings. The presence of a heel would not be detrimental, but is not necessary.

**INSECTS: I. H., Jamaica.** The white material sent is a mass of minute cocoons of a little Ichneumon (genus *Microgaster*), the larvæ of which have destroyed the caterpillar of some moth or butterfly, and then burst out of its body and spun for themselves a general silky covering, as well as a separate cocoon of the same material. *I. O. W.—J. G.* The grubs found at the roots of Seakale, received in a dry shrivelled state, belong to two species of two-winged flies (*Muscidæ*), which it is impossible to identify in this state, and which are usually found (together with the small worms sent with them in some quantity) in decaying, not in healthy, plants. *I. O. W.*

**LYCOPodium FOR COVERING WALL: G. H.** Fix galvanised wire netting at a short distance from the wall so that you can pack turfy peat mixed with sphagnum behind it, rather firmly to prevent subsidence, and with support at intervals. In this the Lycopod will grow freely, but not in the cocoa-nut fibre refuse. The Lycopod enclosed is the *Selaginella Kraussiana*.

commonly miscalled Lycopodium denticulatum in gardens—an old and persistent error.
MINT: A. B. C. Mint may of course be cultivated from seeds; but Mint seed is not an article of commerce in the same sense as Parsley, for instance. The almost universal method of propagating the plant is by cuttings or division of the roots. Your friend must be thinking of something else, for Mint seed certainly is not a common article.

NAMES OF PLANTS: H. K. 7, Pleopeltis pustulata; 8, Begonia Rex; 9, Anomum Cardamomum; 10, Begonia Richardiana; 11, Sanchezia nobilis variegata; 12, Begonia heracleifolia nigricans.—G. W. M. Both your plants are what you suppose them to be. Billbergia nutans was figured lately in the Botanical Magazine, and the authorities at Kew have just received for the first time wild specimens, gathered near Rio Janeiro by Dr. Glaziov.—C. Sharpe & Co. A variety of Primula denticulata, probably the one known as erosia.

NEW ZEALAND: A. B. Write to the Agent-General for New Zealand—Sir Julius Vogel, 7, Westminster Chambers, London, S.W.

WATERLOO PLUM (see Enquiry, p. 154).—John Scott, in the 2d edition of his Orchardist, p. 527, says it is a synonym of Coe's Golden Drop. H. F. Radcliffe.—I have found out that the Waterloo Plum, which I alluded to last week, is a sport, or an improved variety of the Bush Plum, an East Kent market variety, which is valuable for its purpose, but of poor quality for the table, though a fair culinary kind. Geo. Bunyard, Maidstone.

Markets.

COVENT GARDEN, February 5.

Vegetables still remain short, and prices are maintained. The supply of American Apples shows signs of falling off, and well kept home-grown fruit, well sorted, is now asked for. Trade improving. James Webber, Wholesale Apple Market.

PLANTS IN POTS.

Table listing various plants in pots such as Arum Lilies, Azaleas, Begonias, Bouvardias, etc., with prices per dozen.

CUT FLOWERS.

Table listing cut flowers such as Abutilon, Arum Lilies, Azalea, Bouvardias, etc., with prices per dozen.

FRUIT and VEGETABLES table listing items like Apples, Lemons, Onions, Parsley, Peas, etc., with prices per bushel or dozen.

SEEDS.

LONDON: Feb. 4.—Extreme quietness continues to characterise the market for farm seeds, business to-day being quite stopped by a dense fog. Of yearling English red Clover a considerable quantity in the aggregate now offers; but the majority of the samples, being brown and poor in quality, meet with no attention whatever. North American seed is cheaper, and liberal supplies are now coming to hand. From October 1, 1879, to January 23, 1880, the exports of Clover seed from New York to Great Britain were 2219 tons against 783 tons for the corresponding period of last season. There is no quotable variation in white Clover seed. This year Alsike is very cheap relatively. In Trifolium the tendency favours the buyer. Italian and perennial Rye-grasses are steady. Tares meet a ready sale at full prices. The demand for Canary seed is exceedingly slow. Just now there is scarcely anything doing in either Haricots, Lentils, or Peas. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

CORN.

At Mark Lane on Monday trade was very quiet. English Wheat was very slow of sale, and rates were decidedly easier; foreign Wheat also was cheaper to sell. Barley met with a quiet demand, and prices moved somewhat in buyers' favour. Malt was dull, but without alteration. Oats were in larger supply, and quotations receded to the extent of about 6d. per quarter. Maize was dull, with a downward tendency. Beans and Peas moved off quietly on former terms. Flour had a poor sale, and rates were not fully supported.—On Wednesday Wheat, either English or foreign, found very few buyers, and the tone of the market was decidedly heavy. Barley was dull, especially feeding stuffs. Malt was quiet, on former terms. Oats were in limited request, and quotations ruled somewhat in buyers' favour. This last remark applies also to Beans, Peas, and flour.—Average prices of corn for the week ending Jan. 31:—Wheat, 45s. 3d.; Barley, 36s. 4d.; Oats, 21s. 11d. For the corresponding period last year:—Wheat, 38s. 4d.; Barley, 36s. 9d.; Oats, 19s. 5d.

HAY.

Tuesday's Whitechapel Market report states that good hay was in fair demand, but otherwise the market was dull. The supply of Clover was large. Quotations:—Prime Clover, 110s. to 126s.; inferior, 70s. to 100s.; prime meadow hay, 80s. to 95s.; inferior, 30s. to 75s.; and straw, 30s. to 37s. per load.—On Thursday there was a moderate supply of hay on sale. The trade continued very dull, and prices without change.—Cumberland Market quotations:—Superior meadow hay, 98s. to 105s.; inferior, 40s. to 84s.; superior Clover, 120s. to 130s.; inferior, 80s. to 95s.; and straw, 34s. to 38s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that there was a fair trade at firm prices. The supplies were rather limited. Scotch Regents, 140s. to 165s.; do. Champions, 140s. to 150s.; Lincoln Regents, 140s. to 155s.; Victorias, 160s. to 190s. per ton. German reds, 6s. to 7s. 6d.; Belgian kidneys, 6s. to 6s. 8d.; French whites, 4s. 9d. to 5s. per bag.—During last week 6632 bags were received at London from Hamburg, 481 bags from Harlingen, 693 bags from Ghent, 135 bags from Teneuzon, and 572 packages from Malta.

COALS.

The following are the prices current at market during the week:—East Wylam, 16s.; Beside West Hartley, 14s. 9d.; West Hartley, 14s. 9d.; Walls End—Hetton, 16s.; Hetton Lyons, 15s.; Haswell, 16s.; Hawthorns, 15s. 3d.; Lambton, 16s.; Original Hartlepool, 16s. 6d.; Wear, 15s.; South Hetton, 16s.; Tunstall, 15s.; Chilton Tees, 15s. 6d.; Tees, 15s. 9d.

Government Stock.—On Monday the closing price of Consols was 98½ to 98¼ for delivery and the account. Tuesday's figures for the account were 98¼ to 98¼—for delivery, 98¼ to 98¼. The same figures were posted on Wednesday and Thursday at the close of business.

FOR SALE, 2,000,000 TRANSPLANTED FOREST TREES, ALL FINE CLEAN GROWN PLANTS.

Table listing various trees for sale such as Alder, Ash, Broom, Buckthorn, Chestnut, Elm, Holly, Hornbeam, Limes, Maple, Oak, Poplars, Privet, Quick, Sycamore, Thorn, Whin, Willow, with prices per 100 or per 1000.

**IMPROVED FUMIGATING PAN,**  
ALSO THE IMPROVED AND ONLY GENUINE  
**MEDICATED TOBACCO PAPER,**  
"Ready Cut Up," "Self Consuming"  
"Most Effective," "Perfectly Safe."

This "Special" Article has now been extensively used by Horticulturists for some years, and hundreds can bear testimony to the fact that it is the cheapest, safest, and most efficacious Asphyxiate in the market.

TO BE OBTAINED ONLY FROM

**JAMES DICKSON & SONS,**  
**108, EASTGATE ST., CHESTER.**

Who will be pleased to send, post-free, on application, Circular containing Testimonials and all particulars.

Price, 1s. 8d. per pound.

Carriage Paid on Orders of 28 lb. and upwards.

To Gardeners.

FOR TOBACCO PAPER apply to  
H. BAILEY, 63, Weston Street, Bolton, Lancashire.

An Important Discovery.

**SOLUBLE FIR TREE OIL INSECTICIDE.**—The cheapest and best of all insecticides for small and large nurseries, plantations, &c. Once tried always used. Full directions with each Bottle, price 1s. 6d., 2s. 6d. and 12s. 6d. each. Special quotations for large quantities. London Agents: HOOPER AND SONS, Covent Garden, and from all Seedsman. Manufactured by E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.

**GISHURST COMPOUND.**—Used by many of the leading Gardeners since 1859, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsman in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

**CUPISS'S CONSTITUTION BALLS.**

This justly celebrated Medicine for more than 30 years has proved to be the best and cheapest for

**HORSES AND NEAT CATTLE,**  
Cheaper because required to be given only once a week, and not every second or third day,

**PRESERVING HEALTH, VIGOUR AND CONDITION.**  
Their cost, too, is saved by the food turning to a better account, for it is a fact that Horses will keep up their condition better upon three feeds of Oats daily when a Ball is occasionally given than with four feeds without the Balls.

**REARERS OF NEAT CATTLE**  
Will find the Balls most valuable, not only in case of disease, but in Rearing Young Stock, they will Grow to a Larger Size, come to Perfection Sooner, and to a Greater Weight with the same quantity of food if a Dose (see directions) of the Balls is given occasionally.

Prepared by the Proprietor,

**FRANCIS CUPISS, M.R.V.C.S.,**  
**DISS, NORFOLK.**

Author of the PRIZE ESSAY on the "Diseases of the Liver of the Horse."

Sold by all Chemists, in Packets at 1s. 9d. and 3s. 6d. each; or 7 large Packets for 21s., or 7 small for 10s. 6d. Gentlemen using the Balls may consult the Proprietor gratuitously.

**GAWITH'S FIREFLY CIGARETTE,**  
For destroying Thrip, Greenfly, and other greenhouse Pests. The advantages of fumigation over all other methods of destroying these enemies must be apparent to all horticulturists. However skilfully applied, insect-destroying powders cannot reach every one, whereas by rendering the atmosphere of a house destructive, all are reached. These Cigarettes are clean and effective; one trial is enough to convince the most sceptical that a long-looked-for handy and clean destroyer has at last been found. The Cigarette merely requires suspending by the wire attached, lighting at each end as in ordinary fireworks, and does its own work without further attention.

Price 1s. 6d. each. To be had from Seedsman, and from JOHN E. GAWITH, Sole Manufacturer, Lowther Street Tobacco Manufactory, Kendal.

**ORCHID BASKETS** (great reduction in).—Teakwood Rods, rounded edges, made with strong copper or galvanised wire. Every kind made for growing Orchids, at 50 per cent less than usually charged. Sample sent carriage free on receipt of twelve stamps. TEAK RODS supplied, prepared and drilled, ready for making up.  
ALFRED GRANT AND CO., Steam Works, 39 1/2, Leather Lane, London, E.C.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.

"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES AND SONS, Iron Merchants, 6, Backside, Southwark, London, S.E. When ordering Boilers please refer to the above advertisement.

**COALS for HOTHOUSE PURPOSES.**

**WOOD and CO.'S STAR ANTHRACITE SMOKELESS STEAM COAL**

is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-bars.

**WOOD and CO.** deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by **Wood & Co.'s Vans** (in the Metropolis).

**WOOD and CO.** append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

*Tottenham Nurseries, London, N., Dec. 28, 1877.*

To Messrs. Wood & Co. Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully,

(Signed) **G. BECKWITH & SONS.**

**WOOD and CO.** supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application.

**WOOD and CO.,** Coal and Coke Factors, Merchants, Contractors to Her Majesty's Government, 58, Coal Exchange, E.C.; and 4, Coal Department, Great Northern Railway, King's Cross, N.; and Midland Sidings, St. Pancras, N.W.; 94, High Street, Kensington; London, Chatham and Dover Railway Coal Depot, Elephant and Castle; and Great Northern Railway Coal Depot, Sydney Road, Hackney Wick, E.

**Under the Patronage of the Queen.** **J. SMITH'S IMPERISHABLE STRATFORD LABELS.**

The above Labels are made of a White Metal, with RAISED BLACK-FACED LETTERS.

The *Gardeners' Magazine* says:—"We must give these the palm before all other plant labels, as the very first in merit."

Samples and Price Lists free. **J. SMITH,** The Royal Label Factory, Stratford-on-Avon.

Two Gold Medals awarded to us by the Royal Horticultural Society, at the

Grand Show at Preston, July, 1878, out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded Two Gold Medals by the Royal Horticultural Society, this will be some proof of the quality of our productions.

Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil.

**HEATING APPARATUS,** with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

**HARDY FLORISTS' FLOWERS:** their Culture and Management. By JAMES DOUGLAS.

OPINIONS OF THE PRESS.  
"We have in 'Hardy Florists' Flowers' not only a trustworthy, but a tasteful and presentable little volume."—*Gardeners' Chronicle*.

"Mr. Douglas may be said to have presented [in 'Hardy Florists' Flowers'] a series of complete treatises—short, pithy, and to the point."—*The Garden*.

"The book opens with a portrait of the veteran, Charles Turner of Slough, and closes with a capital index; while between the two will be found a Directory for the Florist, which he may follow without fear through every step and stage of work and criticism."—*Gardeners' Magazine*.

"The book is well printed, on excellent paper. . . . We hope it will soon be out of print."—*Journal of Horticulture*.  
JAS. DOUGLAS, Loxford, Ilford, Essex.

**BOROUGH OF NOTTINGHAM.**—The COMMITTEE OF VISITORS of the New Borough Lunatic Asylum, Mapperley Hill, Nottingham, are about to appoint a GARDENER. His wages will be 30s. per week, with house and vegetables. Further particulars may be obtained either personally or by letter from Mr. EVAN POWELL, Medical Superintendent, at the Asylum.—By order,  
SAN GEO. JOHNSON, Town Clerk.  
Municipal Offices, February 3, 1880.

**WANTED, IMMEDIATELY,** a thoroughly practical, experienced HEAD WORKING GARDENER. Must understand all Greenhouse Flowers and Plants, Vines and Peaches, except Stove Plants. One man and a boy found, with occasional labourer. A cottage provided.—Apply, with all particulars, stating age, wages, experience, and character, to Box 19, Post-office, Alford, Lincolnshire.

**WANTED, a GARDENER (SINGLE-HANDED),** married; must thoroughly understand Glass, Flowers, and Vegetables, and possess an undeniable character for sobriety and honesty.—M., Collingwood Lodge, Bagshot, Surrey.

**WANTED, as GARDENER (SINGLE-HANDED),** in a small situation in the suburbs, a skilled Orchid Grower. Age not under 30 nor over 40. Must have at least three or four years' good personal character.—Apply at Messrs. VEITCH AND SON'S, King's Road, Chelsea, S.W.

**WANTED, a GARDENER,** for Temple Ewell, before the end of February. An unmarried man preferred. To take charge of a moderate sized Garden, and willing to make himself useful.—State wages, and address Mr. LEWIS, Temple Ewell, Dover.

**To Gardeners and Propagators.**  
**WANTED IMMEDIATELY,** a steady, trustworthy, sober MAN, who has a thorough knowledge of his Business, to take Charge and Manage a Country Private Garden near a railway station. Must understand Forcing Grapes and all kinds of Fruit Growing, Cucumbers, Roses, Cut Flowers, Vegetables, &c., for Sale and Market purposes. Necessary assistance given, but a strict account must be kept of all goods sold and delivered. A Cottage found if a small family, but no other perquisites allowed.—Apply by letter only, stating salary required, qualifications, where last and formerly employed, to M. P., care of Tucker Brothers, Abergavenny.

**WANTED, an experienced WORKING GARDENER.** Must be accustomed to the cultivation of Flowers and Vegetables.—Address by letter, Mr. ROBERT WILEY, Elmside, Ealing, W.

**WANTED a good WORKING GARDENER (Single-handed):** one who understands Hothouses for Growing Strawberries, Grapes, Ferns, and Plants for a Business.—Apply to JAMES TURNER, Florist, &c., 37, George Street, Richmond, Surrey.

**WANTED, a Married Couple,** without family—Husband as GARDENER, Wife as LAUNDRESS and HOUSEKEEPER.—Apply to Messrs. F. & A. DICKSON & SONS, 106, Eastgate Street, Chester.

**To Gardeners.**  
**WANTED, an abstainer, industrious and honest,** with a fair knowledge of Fruit and Flower Cultivation, and a willingness to do as he is wished. Any one answering to the above description may find a permanent place at 25s. weekly.—Apply, 449, Post Office, Nawborough, near Leicester.

**WANTED, a good WORKING MARKET GARDENER,** who thoroughly understands Growing all kinds of Vegetables in succession, for a large retail shop in the town. The situation would be permanent to a suitable man. State age, wages, and reference, to E. WHITE, The Bournemouth Nurseries and Market Gardens, Bournemouth.

**WANTED, an experienced and industrious man as FOREMAN (Scotch preferred),** on an extensive Market Garden Farm, 15 miles from London. Must have a thorough practical knowledge of all Outdoor Work, and be well able to Superintend both manual and horse labour. Wages 30s., and house.—Apply, in own handwriting, stating references, to R., 34, Wellington Street, Covent Garden, W. C.

**WANTED, a FOREMAN, to Work in the Houses.** Wages £1.—Apply, stating full particulars, to GARDENER, Tigate, Crawley.

**WANTED, IMMEDIATELY, for a small Nursery in Somerset, an active, energetic Man as PROPAGATOR and GENERAL FOREMAN;** required to have a good knowledge of Plant Growing for Market; one accustomed to the Covent Garden Trade preferred.—W. B., Messrs. Hurst & Son, 6, Leadenhall Street, London, E.C.

**WANTED, an INDOOR PROPAGATOR.** Apply, stating age, experience, and wages expected, THOMAS S. WARE, Hale Farm Nursery, Tottenham, London.

**WANTED, AT ONCE, a good PLANTS-MAN,** to Grow for Market and Produce a Regular Supply of Cut Flowers. One from a Market Nursery preferred. Salary from 21s. to 24s., according to qualifications.—Apply, J. D. G., Spring Place Nursery, Shear Bridge, Horton Road, Bradford.

**WANTED, at Whitsuntide, a GARDENER'S ASSISTANT,** unmarried, to take Charge of Houses in the Garden of a Landed Proprietor in the South of Scotland. He must have a good knowledge of the Management of Stove and Greenhouse Plants, as well as of ordinary Garden Work. Free lodging and wages at £1 per week will be given.—Apply to Mr. MUIRHEAD, Estate Office, Paxton Berwick, before February 10.

**WANTED, a sober steady MAN,** about 40 or 45, out of the house, to Assist an Invalid Gentleman, and to work in the Garden.—Address by letter first, stating wages, &c., to M. C., B. Maller, Burnt Ash Lane Nurseries, Lee, S.E.

**H. B. MAY requires an active Young MAN,** who is quick at Potting, &c.; must be diligent and attentive. Wages 20s. per week.—Dyson's Lane Nursery, Edmonton, Middlesex.

**GARDENERS.**—The ADVERTISER will ENGAGE two active Youths as IMPROVERS. No Premium. Extensive glasshouses. None need apply whose character will not bear strict investigation. Wages from 5s. to 7s. per week, with lodgings.—J. W. B., Mr. Wilkinson, Catford Bridge, Kent, S.E.

#### WANT PLACES.

**DOWNIE AND LAIRD** can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

**EPPS'S COCOA.**  
**GRATEFUL AND COMFORTING.**  
"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.  
JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
**HOLLOWAY'S OINTMENT and PILLS.**  
—Much watchfulness must be exercised at the present time, and the earliest evidences of ill-health must be immediately checked, or a slight illness may result in a serious malady. Relaxed and Sore Throat, Quinsy, Coughs, Chronic Cough, Bronchitis, and most other pulmonary affections will be relieved by rubbing this cooling Ointment into the skin as near as practicable to the seat of mischief. This treatment, so simple and effective, is admirably adapted for the removal of these diseases during infancy and youth. Old Asthmatic invalids will derive marvellous relief from the use of Holloway's remedies, which have brought round many such sufferers, and re-established health after every other means had signally failed.

**CAUTION TO THE TRADE.**

THE FOLLOWING IS REGISTERED AS

Choice Imported Orchids, from the Philippine ISLANDS and BURMAH.

MR. J. C. STEVENS will SELL by AUCTION, at his great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, February 18, at half-past 12 o'clock precisely, by order of Messrs. H. Low & Co., fine IMPORTED PLANTS, in the best possible condition, of the rare and lovely Cypripedium Haynaldianum, many of them very fine masses, and all with green healthy leaves and young growths; Cypripedium Argus, Dendrochilum filiforme, Dendrobium heterocarpum philippense, D. macrophyllum giganteum, D. formosum giganteum, D. cretaceum, D. finbrinium oculatum, D. albo-sanguineum, D. aggregatum majus, D. infundibulum, Vanda Batemannii, Saccolabium curvifolium, S. Blumei majus var. Dayi, amongst them one mass on native wood 4 feet in length; Cologyne Parishii, and other choice ORCHIDS.

At the same time will be offered healthy established plants of Phalaenopsis Schilleriana, Cymbidium Lowianum, Cattleya Dowiana, Cypripedium Boxalli, &c.

May be viewed the morning of Sale, and Catalogues had.

Valuable Importations of Orchids.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL BY AUCTION, at his great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, February 19, at half-past 12 o'clock precisely, a splendid importation of ODONTOGLOSSUM LUTEOPURPUREUM SCEPTRUM. Prof. Dr. Reichenbach writes, "This variety differs principally from O. luteo-purpureum through its much closer inflorescence and magnificent contrast of dark and light colours." Flowers tinged brown and yellow, lip fringed, yellow barred brown. A large consignment of BATEMANNIA BURTI, the best of the Costa Rica Orchids, sepals and petals lower half pure white, upper half chocolate-brown, flowers 5 inches in diameter; ODONTOGLOSSUM HALLI LEUCOGLOSSUM, the white-lipped variety collected by Mr. Lehmann; a large lot of ANGULOA CLOWESII and LYCASTE GIGANTEA, a grand importation of CATTLEYA TRIANAE in splendid masses, the rare and magnificent ODONTOGLOSSUM POLYXANTHUM, in large and healthy specimens; O. VEXILLARIUM and ROSSI MAJUS; the new RESTREPIA FALKENBERGI, CATTLEYA MENDELLI, MORMODES PARDINUM, LELIA FURFURACEA, ONCIDIUM FUSCATUM, and others.

Flowers and Drawings will be on view.

May be viewed the morning of Sale, and Catalogues had.

Roses, Fruit Trees, Shrubs, &c.

MR. J. C. STEVENS will, SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on SATURDAY, February 21, at half-past 12 o'clock precisely, first-class STANDARD ROSES, from well-known English growers, Dwarf-trained and Pyramid FRUIT TREES, Herbaceous PLANTS, SHRUBS, GLADIOLI, LILYUMS, SPIRÆAS, LILY of the VALLEY, RUSTIC GARDEN-WORK, &c.

On view the morning of Sale, and Catalogues had.

4000 Lillium auratum from Japan, and other choice LILIES, PLANTS, &c.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, February 23, at half-past 12 o'clock precisely, 4000 very fine bulbs of LILYUM AURATUM, just arrived from Japan in the best possible condition; also an importation from Japan of gigantic bulbs of LILYUM LANCFOLIUM ALBUM and RUBRUM, L. KRAMEERI, and various other choice LILIES; an importation of Japanese ORCHIDS; SARRACENIAS from New Jersey; some fine roots of TIGRIDIA GRANDIFLORA and CONCHIFLORA; 600 bulbs of PANCRATIUM AMENUM; an importation of AMARYLLIS BELLADONNA; 2000 fine roots of American TUBEROSES; English grown LILIES, choice GLADIOLI, SPIRÆAS, LILY of the VALLEY, &c.

May be viewed the morning of Sale, and Catalogues had.

Extensive Nursery Clearance Sale at Dalketh.

MR. DAVID MITCHELL, HORTICULTURAL AUCTIONEER, VALUATOR, and ESTATE AGENT, has received instructions from Messrs. Ballantyne & Son (who are retiring from the nursery business) to DISPOSE OF, by PUBLIC AUCTION, at their Nurseries, Dalketh, on THURSDAY and FRIDAY, February 19 and 20, at 11 o'clock in the forenoon of each day prompt, the whole of the valuable NURSERY STOCK, consisting of choice Ornamental, Deciduous, Coniferous, and Evergreen Trees, Shrubs, and Plants, many of them of rare excellence and even unique in character; also a fine lot of Specimen, Hybrid, named, and other Rhododendrons of leading kinds; Hardy Ericas, Herbaceous and other Plants; a most extensive stock of well-grown and well-rooted Forest Trees; together with a splendid lot of Laurels, comprising Colchic, Caucasian, Common, and Portugal; and other things too numerous to mention in an Advertisement.

N.B. The Auctioneer would beg to draw the attention of those intending to plant to this most important Sale. The Messrs. Ballantyne & Son's Nurseries have always been famous for well-grown and well-rooted Shrubs and Trees.

Catalogues in preparation.

6, Comely Bank, Edinburgh, February 4, 1880.

To Florists.

THE GOODWILL of a FLORIST'S BUSINESS in Piccadilly can be obtained, with immediate possession of the Shop, on taking Trade Fixtures at Valuation, owing to the Advertiser's retirement through ill-health. Apply to

Mr. REARDEN, 92, Piccadilly, W.

Surrey.

TO BE LET, an old-established NURSERY, with an excellent connection, of about 16 Acres, with Dwelling-house and Cottages, very advantageously situated in a neighbourhood renowned for the Nursery Business, and only about a mile from the Addlestone Station, and 2 miles from the Woking Station on the South-Western Railway. For further particulars apply to Messrs. R. & J. WATERER AND SON, Auctioneers and Valuers, Chertsey.

TO LET, ROSEHILL GARDENS, NORTON, and may be entered upon at the November Term—the above Gardens comprising about 7 acres of first-class Garden ground, with the Dwelling-house, Vineries, &c. Now in the occupation of Mr. T. Oliver as Tenant. For particulars apply to J. J. FENNY, Stockton-on-Tees.

To Gardeners, Florists, &c., wishing to Commence BUSINESS.

TO BE LET, with Immediate Possession, a handsome large GREENHOUSE, SHOWHOUSE, LIGHTS, &c., with a large Piece of Ground. Within 3 miles of Covent Garden. Incoming by valuation (about £85). Rent low. Address, X. Y., Gardeners' Chronicle Office, W.C.

J. T. DEANE, LANDSCAPE GARDENER.—Planting by Contract or Otherwise, Ornamental Lakes, Rockwork, &c. References kindly permitted to Noblemen and Gentlemen—places already carried out. Plans and Estimates furnished.—Wellesley House, Wellington Road, Orpington, Kent.

BRIER STOCKS.—For Sale, 2300 good Briers, from 3 to 4 feet high, all carefully laid in. Price per 100, 10s.; per 1000, £4, on rail, for cash on receipt of goods. Apply G. WOBBERV, Dunsfold, Godalming, Surrey.

PEACHES and NECTARINES.—Extra sized Dwarf-trained—(the Trade supplied)—are offered by GEORGE SMITH, The Dell Nursery, Rock Ferry, Cheshire.

Montbretia Pottsil.

See Illustration in the Garden of January 24.

THE LAWSON SEED and NURSERY CO. (Limited), Edinburgh and London, are now Booking Orders for Flowering Bulbs of the above named Hardy Cape Bulb, having secured the stock from Mr. Potts, the introducer of it. Price 2s. 6d. each, or 24s. per dozen; the usual discount to the Trade.

Special Offer to Farmers, Gardeners, and Others. GEE'S SUPERIOR BEDFORDSHIRE GROWN SEED POTATOS, CABBAGE, and SAVOY PLANTS, &c.

F. GEE has fine stocks of the above, which have been grown carefully on new land, fine samples, free from disease, and such that he can highly recommend to all who require a change of seed. They can be supplied in almost any quantities (if unsold) as follows (put on G.N. rails.) for cash with orders:—

Table with 5 columns: Item Name, Per Peck of 14 lb., Per Bush of 56 lb., Per Cwt. of 112 lb., Per Ton. Items include EARLY ASHLEAF KIDNEY, EARLY ROSE and CLIMAX, LATE ROSE and PEERLESS, NEW BEAUTY of HEERON, NEW BURLANK SEEDLING and THE WASHINGTON, NEW MAGNUM BONUM, NEW SCOTCH CHAMPION, PORTER'S EXCELSIOR.

Good Peck Bags charged 3d. each, Bushels 6d., and Common Sacks, to hold 1½ Cwt., 8d. each.

Superior CABBAGE and SAVOY PLANTS, from F. GEE's noted stocks. The past severe winter has been very disastrous to the above; many crops are destroyed. Good plants are scarce and dear. F. GEE can supply a large quantity of fine stuff, and CATALOGUES and lowest prices also of FARM and GARDEN SEEDS, on application to F. GEE, Biggleswade, Beds.

LILIES, Superior, of English growth. BULBOUS PLANTS of all kinds. HARDY ORCHIDS, and ORCHIDS for Cool-house culture. Before Purchasing, see CATALOGUE of the NEW PLANT and BULB CO., Colchester. Post-free on application. Dr. Wallace's "Notes on Lilies," Illustrated, post-free 5s. 6d.

LILYUM AURATUM.—Splendid Bulbs of this fine Lily at Reduced Prices, 6d., 9d., 1s. and 1s. 6d. each. For other new Lilies, rare and cheap Orchids, apply for CATALOGUE to WM. GORDON, Bulb and Plant Importer, 10, Cullum Street, London, E.C. Liberal discount to the Trade.

QUICK, 100,000 fine strong and extra strong; also strong LARCH, Austrian PINE, fine specimens, 6 to 9 feet; strong PURPLE BEECH, &c. W. GROVE, Tupsley, Hereford.

CYCLAMEN PERSICUM, showing large quantities of bloom, 30s. per 100; sample dozen, 5s. WHITE VESUVIUS, 20s. per 100; 3s. per dozen. GLOXINIA BULBS (finest), 6s. per dozen. All package free. GEORGE GUMMOW, 114, Loughborough Road, Brixton, S.W.

LARCH and SPRUCE FIR, splendid, 2 to 3 feet. See advertisement in Gardeners' Chronicle, first page, February 7. W. JACKSON AND CO., Bedale.

MAGNUM BONUM POTATOS.—A splendid sample of the above, grown from Seed, direct from the raiser (Mr. Clarke), price 7s. 6d. per bushel of 56 lb., free on rail, sacks included. Also about 10,000 strong HAZEL, at 15s. per 1000. H. T. BATH, Seedsman, &c., 80, High Street, Lymington.

PRIMULA NIVALIS TURKESTANICA.—By far the handsomest Primrose of Central Asia. This will be hailed with delight as a long-desired addition to our hardy alpine plants. Flowers an inch in diameter, finely shaped, and of a bright violet colour. 1s. 7d. per packet, with directions. Cash with order.—W. J. MARSH, Woodbridge, Suffolk.

CENTAUREAS for PRESENT POTTING.—Centaura candidissima and C. ragusina compacta, 9s. per 100; C. gymnocarpa, 10s. 6d. per 100; all summer-sown plants from stores. Fifty and upwards sent free for cash. STOCKS, East Lothian Intermediate, strong plants from frames, in three colours, 1s. 6d. per dozen, 8s. per 100. J. J. MARRIOTT, Highfield Nurseries, Matlock, Derbyshire.

To the Trade and Others.

S. BIDE has to offer a very fine lot of 2-yr. Seedling SCOTCH FIR (very scarce this season), sample and price of which will be forwarded on application to S. BIDE, Alma Nursery, Farnham, Surrey.

Quicks—Quicks.

THORN QUICKS.—About 60,000 good strong, 3-yr., cut back and transplanted last Spring, to be sold at 12s. per 1000. Apply to WM. BRAV, Nurseryman, Okehampton.

To the Trade.

JOHN NELSON, Thorn Bank Nursery, Catcliffe, near Rotherham, has the following to offer:—CHERRIES, strong Standard sorts, good heads, 75s. per 100. " " May Dukes, Maidens, 50s. per 100. " " Dwarf-trained sorts, 80s. per 100. HOLLIES, 1 to 1½ foot, 16s. per 100; 1½ to 2 feet, 30s. per 100; 2 to 3 feet, 45s. per 100. POTATOS, Myatt's Kidney, £10 10s. per ton.

To the Trade and Large Buyers.

B. HURST begs to offer, cheap:—4000 extra fine Red Dutch and Grape CURRANTS. 500 extra fine WASHINGTON RED GOOSEBERRIES. 300 extra fine GOOSEBERRIES of sorts. All on good stems, of clean and most healthy growth. Samples and prices on application. The Nurseries, Burbage, Hinckley.

WALNUT TREES.—For Sale, some unusually fine trees, from 6 to 10 feet; will shift well. Apply, Mr. COOPER, Calcot Gardens, Reading.

Webb's Prize Cob Nut Trees. CALCOT GARDENS, NEAR READING, BERKS. MR. COOPER, having succeeded to these Gardens, and being about to make considerable alterations, is desirous of reducing the valuable stock of PRIZE COB FILBERT TREES, for the cultivation of which the late Mr. Webb was so justly celebrated.

Mr. COOPER desires to caution the public in purchasing Nut Trees advertised as WEBB'S PRIZE COB FILBERT TREES, as no one is authorised by him to sell them. Early applications should be made, addressed Mr. COOPER, Calcot Gardens, near Reading, Berks.

SEED POTATOS.—Snowflake, Early Rose, Myatt's Prolific, Fortyfold, Bresee's Prolific, Early Shaw, Paterson's Victoria, Regent, Dalmahoy, Fluke, Champion (Scotch), Redskin Flourball. And other leading varieties. Prices on application to JOSIAH H. BATH, York Street, Borough Market, S.E.

Immense Quantities of Young FOREST TREES, CONIFEROUS, ORNAMENTAL TREES and SHRUBS, ROSES, FRUIT TREES, and 3-yr. QUICKS, very cheap. CATALOGUES will be sent free on application. LEVYASSEUR AND SON, Nurserymen, Ussy, Calvados, France. Agents: Messrs. R. SILBERRAD AND SON, 15, Harp Lane, Great Tower Street, London, E.C.

Avenue and Park Planting. WM. MAULE AND SONS offer:—WELLINGTONIAS, 6 to 8 feet; DEODARAS, 8 to 10 feet and upwards; ARAUCARIAS, 5 to 6 feet, at 10s. 6d. each, in equal proportions, and will deliver any quantity—not less than one dozen—carriage free to any railway station in direct communication, within a hundred miles. 247 Trm. cash, or good reference. The Nurseries, Bristol.

Planting for Immediate Effect. THE EXECUTORS of the late T. STANSFIELD have to offer a large stock of clean, well-grown, and well-rooted FOREST and ORNAMENTAL TREES, at exceptionally low prices. The following may be specially mentioned:—LABURNUMS, 8 to 14 feet, strong, clean, and shapely, 3s. to 24s. per dozen.

BEECH, 6 to 9 feet, 12s. to 15s. per 100. POPLARS, Ontario, 15 feet, 10s. per 100. SYCAMORES, 6 to 15 feet, 6s. to 40s. per 100. HORSE CHESTNUTS, 5 to 12 feet, 6s. to 30s. per 100. LIMES, 6 to 15 feet, 15s. to 4s. per 100. ALDER, 16 feet, a few large 1s. each. BIRCH, 16 feet, " " 1s. each. ELMS, English and other, 4s. per dozen. YEWs, English, 3 feet, 25s. per 100. LONICERA LEDEBOURII, 6s. per 100. CUPRESSUS LAWSONIANA, perfectly shaped, well-furnished, healthy plants, 5 to 8 feet, 9s. to 15s. per dozen. The Limes, Laburnums, and Sycamores are particularly recommended for avenues and for planting as specimens in conspicuous situations. LIST on application. Tanshelf Nursery, Pontefract.

POTATOS FOR PLANTING.—The undersigned begs to inform the Trade that he planted over 300 Acres last season, and can offer at low prices, for cash, the following sorts, viz:—Beauty of Hebron, imported, Lapstone Kidney, English grown, Magnum Bonum, Old Ashtop, Paterson's Victoria, Mona's Pride Ashtop, Scotch Champion, Myatt's Prolific, Regents, and Early Rose, Snowflake, Red-skin Flourball. Price LIST on receipt of Trade Card. CHRISTMAS QUINCEY, Potato Importer, Exporter and Merchant, Peterborough.

Stock Plants. GERANIUMS.—Stock Plants of New and valuable Geraniums with cuttings, for cash. The magnificent new Silver-edged Geraniums, with grand flowers of all colours, strong plants at 6d. per dozen, 25s. per 100, packed and put on rail. Strong rooted cuttings of all the best sorts 3s. per dozen, or 18s. per 100, by post. Cuttings 10s. 6d. per 100, post-free. LISTS free on application. P.O.O. payable to CHARLES BURLEY, Nurseries, &c., Brentwood, Essex.

QUICKS.—Whitethorn, extra strong, well-rooted, 1 1/2 to 3 feet, 3-yr., at 14s. per 100 (nett); about 300,000. P.S. Price LISTS of Herbaceous and Alpine Plants, Fruit Trees, &c.; also CATALOGUES of Kitchen Garden, Flower, and Agricultural Seeds, at very moderate prices, post-free on application. W. BALL AND CO., Seed Growers and Nurserymen, Bedford Road, Northampton.

New Cucumber, Sir Garnet Wolseley. JOSEPH HAMILTON AND SON, Wellington Place, near Carlisle, will supply SEEDS of the above, in Packets of 6 Seeds, post-free for 30 stamps. "The points in which this Cucumber Sir Garnet Wolseley surpasses all other long-fruited varieties are the symmetry of its fruit, and the abundance with which they are produced; there being no shank or handle to Sir Garnet."—Gardeners' Chronicle, September 27, 1879.

Green and Variegated Ivies of Sorts, Large and small-leaved, in eight kinds. ROBERT PARKER, having a Surplus Stock of five Plants in pots of the above-named, will be pleased to dispose of them in quantities at very low prices. Names, sizes, and prices per dozen, 100, or 1000, will be given on application. Exotic Nursery, Tooting, Surrey, S.W.

**AN INVESTMENT.**

That Timber Growing will be found to be a profitable application of the soil, and a sound investment to Capitalists in the future, is being made obvious by the increasing demand for Wood, and its anticipated scarcity in places abroad.

Nurseries have long been noted in Scotland for successfully and cheaply raising FOREST and other TREES, and the Subscribers devote every attention to conducting efficiently one of the largest establishments in the country.

In connection with their business arrangements Correspondents are respectfully reminded that their Priced CATALOGUES are sent, post-free, on application. The prices are quoted as reasonable as any. Plants are fibrous-rooted, robust, and grown unsheltered. Inspection of Nurseries invited, but if inconvenient, Samples of Trees will be furnished. Planting contracted for, Carriage Rates lessened, and Packages saved by using "Through Trucks." Export Orders carefully supplied, and Correspondence solicited.

**Gardeners' Chronicle.**

SATURDAY, FEBRUARY 14, 1880.

**CHILHAM CASTLE.**

IN the Valley of the Stour, five miles from Canterbury, stands Chilham Castle, on a site approved by Romans, Saxons, Normans, and modern English, each in their turn. The picturesque little village of Chilham covers, with the Castle at whose gate it stands, a spur of the chalk down which lifts it high above the valley. The Roman fortress stood on the same site as the present castle, and its commanding situation rendered it a place of great importance. After the departure of the Romans the place was occupied by the Saxon kings of Kent.

The present Norman castle was erected at the same time as Dover Castle. Immediately after the Norman Conquest, John de Fiennes was appointed Constable of Dover Castle, and commissioned by William to replace the recently erected Saxon stronghold by a Norman castle. It was by far the noblest Norman castle ever built in England. Lands and lordships were granted to De Fiennes to defray the cost, and a number of confederate knights assisted him in his undertaking. Each received land and knights' fees, held on feudal tenure, and each built a portion of the surrounding wall and a tower. The materials used were the "everlasting flints" gathered from the chalk hills around, and in proof of the excellence of the workmanship, the Constable's great gateway on the Deal road, and the tower built by Fulbert de Dover of Chilham, are still sound and strong. Fulbert Lord de Dover's land consisted of ten knights' fees in all, and two of these were at Chilham, which was the head of his barony. He lived here among his military tenants during that part of the year when his personal services were not required at Dover, and he built here the castle whose keep still crowns the hill. It is a most convenient and delightful site. A thick shubbery hides the castle ditch, Lime trees and Yews half conceal the ancient building, and the railway from Ashford to Margate winds gracefully through the valley. One of the three heronries of Kent has been long established among the beeches of Chilham Park.

The history of the succession of the Chilham property is curious, inasmuch as a reverse of fortune has overtaken many successive owners. In 1292 Isabel de Dover, descendant of Fulbert de Dover, and wife of the Earl of Athole, died here without an heir—her son, the Earl of Athole, having been executed. The castle and manor therefore reverted to the Crown, and was shortly afterwards granted to an extensive landowner named Bedlesmere, the proprietor of Leeds Castle, near Maidstone. He, too, was beheaded by Edward I. for shutting his gates in the face of Queen Isabel. The Earl of Athole, grandson of Isabel de Dover, came next into possession and died. By favour of the Crown a son of the aforementioned Bedlesmere followed, and left, at his death, no

hair to his ancient name, but only daughters. His house, therefore, became extinct, and Chilham passed to Lord Roos, his son-in-law, who soon suffered the misfortune of attainder. Once more Chilham passed to the Crown, and at the death of Sir John Scott, to whom it was granted, it again reverted to the Crown. This was in 1485, and a new era in regard to the ownership of land had commenced. Chilham was granted by Henry VIII. to Thomas Manners, Lord Roos, who was created Earl of Rutland. It passed once more to the king, but this time by sale. It was then granted to Sir Thomas Cheney, who pulled down the whole of the building except the keep, and used the materials for the completion of his house at Shurland. Numerous owners have intervened between the Cheneys and the Hardys, including the Herons, not the family in possession of the beeches in the park, but an ancient family of Northumberland, who bore for their arms, *Gules, three herons, argent.*

A singular custom prevailed here during many years. By a will of Sir Dudley Digges, dated 1638, £20 were left as prizes in a race, which was held annually until lately, between two young men and two maidens, at a spot called Old Wives' Lees. The winning couple were entitled to £10 each, man and maid. The money is now awarded in prizes to the children of the National School.

The word Chilham, called in Saxon Cyleham, signifies, says Hasted in his *History of Kent*, the cold place.

Chilham Castle is now the property and residence of Mr. Hardy, in succession to Sir Dudley Digges, who built the fine old English mansion near the keep, in which the owners of the property have since resided. *H. E.*

## New Garden Plants.

### NEPENTHES BICALCARATA, *J. D. Hook.\**

This is a very remarkable Pitcher-plant, new to gardens but described by Sir Joseph Hooker some few years ago from dried specimens collected in Borneo by Low and others. To Mr. Burbidge, however, belongs the credit of introducing the plant in a living state to Messrs. Veitch's nurseries. It was exhibited before the Royal Horticultural Society on Tuesday last, side by side with the dried specimens. Even in the relatively small state as shown it is a Pitcher-plant of very marked characteristics, and imply justified the award of a First-class Certificate made to it. The leaves are of a peculiar dark green; the bag-shaped pitchers are covered, when young, with a fluffy rust-covered down, and are, when fully developed, provided with two sharply-toothed wings. The neck of the pitcher is thrown into ridges with intervening furrows, and is prolonged at the back into an erect, or slightly incurved process, terminating in the two recurved spurs, like the fangs of a snake with its head uplifted to strike. These formidable looking spurs are nothing but enlargements of the ordinary ridges surrounding the mouth. A smaller spur, or conical spine, is met with in some cases on the under surface of the lid, while from the back of the prolonged neck of the pitcher projects a blunt hook covered with hairs. The spurs would seem calculated to serve, as a rat-trap might do, to imprison vagrant insects. What the hook at the back means we cannot guess in the absence of sufficiently young specimens—nor can we guess its purpose, if it have any, unless it be as a means of support. The specimens at South Kensington were also remarkable for the presence of small scattered conical prickles on the stalk of the pitcher, which are shown in Mr. W. G. Smith's illustration, but are not mentioned in the original description. In the illustration (fig. 36) the shaded pitcher is from the living plant; the outline figure serves to show the size of the dried specimens.

We strongly suspect that Mr. S. Le M. Moore's *N. Dyak*, figured in the *Journal of Botany* for January, 1880, will turn out to be an immature state of the present plant. *M. T. M.*

### POPHOS CELATOCAULIS, *N. E. Br.*

The plant to which I apply the above provisional name was introduced from N.W. Borneo by Mr.

Burbidge into Messrs. Veitch's nursery. It is a handsome and interesting climber, lying perfectly flat upon the surface it climbs over, being held in position by its numerous adventitious roots, and as it is a rapid grower, it is admirably adapted for covering walls, trunks of Tree Ferns, &c. In general appearance it at present has much the look of the barren shoots of another curious *Arad*, figured in this journal, vol. viii., n.s., p. 13, fig. 2, as *Marcgraavia paradoxa*, and which, by the way, is probably a species of *Monstera*. The stems are flat on the under side, convex on the upper side, and give out from the under side at every node a tuft of, and along the internodes a few, adventitious roots. Leaves oblique, sessile, with a short clasping sheath, prolonged a little beyond the insertion of the blade; in outline the leaf is broadly elliptic, very obtuse at apex, and cordate at base; from near the base of the midrib on each side are given off about four strong ascending curved primary veins; the upper surface is of a rich dark green with a slight velvety sheen, the under surface is pale green and minutely crystalline. Each leaf overlaps the base of the one above it in such a manner that the stem is entirely concealed, hence the specific name. There is little doubt that the present condition of this plant, to which the above description applies, is quite different from the flowering state, and it is just possible that when it flowers it may prove to be an already described plant, but as there is nothing in the Kew Herbarium with which I can unite it, and Borneo is by no means exhausted of its novelties, I venture to give it the above provisional name. *N. E. Brown, Kew.*

### TILLANDSIA (PLATYSTACHYS) DISTACHYA, *Baker, n. sp.\**

This is a new species of the large section *Platystachys*, closely allied to *T. polystachya*, Linn., and *T. fasciculata*, Swartz. It was sent by Mr. Gabb from British Honduras to the Kew collection, and flowered here in January, 1880.

Whole plant about a foot high, epiphytic. Leaves twelve to fifteen in a sessile rosette, lanceolate acuminate, about a foot long, the dilated base 1 inch, the middle of the lamina  $\frac{1}{2}$  inch broad, the face pale green, concave, glabrous upwards, finely thinly lepidote towards the base, the convex back thinly lepidote throughout. Peduncle erect, half a foot long, hidden by its linear acuminate falcate leaves. Spikes 2, distichous,  $\frac{1}{2}$  inch broad, 6–12-flowered, the end one  $1\frac{1}{2}$  to 2 inches long. Flower-bracts green, glabrous, oblong-lanceolate, about 1 inch long. Calyx  $\frac{3}{4}$  inch long, falling a little short of its enveloping bract; its lanceolate glabrous sepals free to the base. Corolla white, more than twice as long as the calyx; sepals oblanceolate, with a long claw, not scaled,  $\frac{1}{4}$  inch broad. Stamens and style protruded, the longest stamens reaching about  $\frac{1}{2}$  inch beyond the tip of the petals; anthers minute, yellow; style  $1\frac{1}{2}$  inch long; stigma spirally twisted. *J. G. Baker.*

### ODONTOGLOSSUM ROSSII (*Lindl.*) PALLEUS, *n. var.*

Though I have written some time ago about the variations of this very well known plant, I have now to add a new thing. Mr. W. Bull sends me a variety with very pallid ochre-coloured flowers, the callus of the lip having but very few very light brown spots inside. *H. G. Rehb. f.*

### MASDEVALLIA PULVINARIS, *n. sp.†*

This is a very curious thing. The leaf is remarkably coriaceous, spatulate, oblong-ligulate acute, with a sharp keel in the middle line underneath, nearly 2 inches broad, nearly a span long. The very strong peduncle is covered with warts and a few sheaths. The raceme is lax, eight-flowered in the good specimen at hand, flowers two-ranked. There are two open flowers, two buds projecting beyond the bracts, the remaining buds inclosed in the triangular sharp keeled deep green bracts. Odd sepal triangular cucullate, prolonged into a tail that surpasses its length; it is olive-green, with three nerves, the blotches and tail of a purple tint. The tip of the tail is highly curious, quite

\* *Tillandsia (Platystachys) distachya*, Baker, n. sp.—Acaulis, foliis 12–15 lanceolatis longe acuminatis subpedalibus facie concavis dorsum tenuiter lepidotis dorso convexis ubique magis lepidotis, pedunculo semipedali; foliis pluribus linearibus acuminatis bracteato; spicis 2 distichis densis 6–12 floris; bracteis floralibus oblongo-lanceolatis navicularibus glabris arcte imbricatis; calyce bractea paulo brevior sepals lanceolatis; petalis albis calyce duplo longioribus lanceolatis baud squamatis; genitalibus breviter exsertis.

† *Masdevallia pulvinaris*, n. sp.—Aff. *Masdevallia* oetholi: folio cuneato oblongo-ligulato acuto firmo ultra spithamæ; pedunculo ulnari densissime verrucoso, distanter vaginato; racemo laxo paucifloro disticho; ovario pedicellatis sigmoidibus, bracteis acutis bene excedentibus; sepalis impari triangulo cum cauda longiori apice clavato breviter falcato unguiculiferis; sepals paribus connatis oblongis brevi bicaudatis, inapicilari dimidio ante caudas pulvinatis; pulvinari carnos oblongo profunde fisso; tepalis oblongis acutis obliquis, denticulo in margine superiori; labello oblongo-ligulato, utrinque bis emarginato, hinc simivis bipandurato, antice limbo serrulato, carinis serrulatis geminis in disco; columna alis rhombicis.—Sepala ovivacea purpureo-brunneo striata, caudis purpureis. Pulvinari ovaceum. Tepala flava maculis purpureis. Labellum albo-flaveolum maculis atropurpureis. Columna flava maculis utrinque flavis ad alas.—Flos quam ille *Masdevallia* oethodis bene injator. *H. G. Rehb. f.*

blunt, with a small curved point just like a cat's claw. The equal sepals are connate for two-thirds of their length, and have two purple tails much shorter than the blade, which is olive-green, with dark brown nerves, and two large, fleshy, oblong, contiguous cushions, which suggested the name. Petals, column, and the curious quasi-bipandurate lip yellowish-white with very dark and lighter spots. I obtained this curious plant from Mr. Joseph Calvert, 2, Brook Road, Wood Green, London. *H. G. Rehb. f.*

### ODONTOGLOSSUM ROSSII MUSAICUM, *n. var.*

I thought I had seen all the varieties of the species, yet the importations by many hundreds would appear to indicate an unexhausted store. This is a lovely variety. It belongs to the rubescens set, having a rather violet column, and a light violet blade to the lip. The violet petals have the lower halves covered by a large and beautiful blotch, green and yellow, and with splendid Horse Chestnut-brown lobes, streaked and dotted. The sepals have a multitude of spots and lobes, and streaks of Horse Chestnut-brown, all with green margins, and the whole nested on a lighter yellowish ground. What a dreadful object for a painter! Neither Mr. Fitch nor Mr. W. G. Smith might have patience to paint this object. It might have been done by the Brothers Bauer, who used to spend weeks in drawing objects which are done now-a-days in hours. (Thus I was informed by R. Brown himself, and that may be known by those who say our artists are no longer Bauers. Pay them by time, and they may by-and-bye get accustomed to such ancient work.) I obtained this gay novelty from Mr. Bull. *H. G. Rehb. f.*

### CYPRIPEDIUM STENOPHYLLUM, *Rehb. f.*

This is a very strong plant when fully developed. Mr. Bull just sent me an inflorescence, with fine branches, showing vestiges of thirty-eight flowers. The hairs appears to be much stiffer than in *C. Sedeni*. The lower parts of the inflorescence are naked. I am informed this hybrid was raised by Mr. Bowring, and the specimen just flowered by that gentleman. See also our columns, 1876, April 8, p. 461. *H. G. Rehb. f.*

## GARDENING FOR LADIES.

SELF HELP.—In the present day, when so much is said and so much is arranged with regard to the instruction of ladies by lectures and classes in various branches of science, the idea suggests itself whether, with regard to horticulture and allied subjects, something might not be said in favour of what can be done at home in the way of self-tuition from the many excellent books now easily procurable, and also of self-help from the many sources of practical instruction which—at least in the rural districts—lie always open to use from the workers of the neighbourhood.

The subject of natural history teaching to ladies appears at present to be often divided into two parts, acting in direct opposition to each other. Doubtless, all properly available instruction is most desirable, and especially such as may be made serviceable for home use; but why in many cases does this instruction begin so late?

The young lady student often comes to the lecture without a grain of the preliminary acquaintance with practical gardening, or of the commonest knowledge of how plants grow, which would enable her at once to grasp the further teachings of the lecturer; and which might with a little encouragement have been picked up gradually in the home garden, with nothing but pleasant work for mind and body. In the same family, where the elders amongst the young people are studying botany or gardening in form, the younger ones are often painfully checked or thwarted in their practical attempts, if not by the scientific aspirant, yet frequently by all others about them, for damage to clothes, &c., all too well known to those who try to foster the simple tastes of the rising generation.

At present there appears to be a further move in contemplation towards teaching the ordinary details of management of garden, poultry-yard, and the lighter matters of forestry or farming sometimes coming under a lady's management in country life by a species of collegiate teaching, and it may be well worth while to consider whether, not only as a matter of education generally, as well as from the limited view of instruction on the special subject, all this might not, with a little encouragement, be much better learnt at home.

From the time that a child can stand firmly enough to use a light tool she may begin to gain knowledge of gardening, and gradually and imperceptibly the

\* *Nepenthes bicalcarata*, J. D. Hook., in *DC. Prod.* xvii. 97 (1837).—Caulis cylindraceo glaberrimo; foliis membranaceis elongato vel obovato-lanceolatis glabris, nervis longitudinalibus numerosis, petiolo elongato amplexicauli; ascidiis brevibus turgidis, peristomio creberrime costato secus collum elongatum in cristam pectinatam apice longe valide 2-calcaratam producto, operculo reniformi. In Borneo, Low; Sarawak, Beccari, Hook. *Ac.* [Lazas River, Burbidge.]

FIG. 36.—NEPENTHES BICALCARATA. (SEE P. 200.)

great problems of vegetable action, the depth suitable for germination of seeds or for the growth of bulbs, the action of light and moisture, the treatment of the plants by pruning, &c.—subjects on which information is acquired with tedious and difficulty by theoretical instruction in advanced youth, are fairly impressed, sufficiently for common garden purposes, on the young heads which have been allowed to use their hands from childhood in the home garden.

And who shall say that this is not scientific knowledge? The young folks may be quite unaware of it, but they are taking in by imitation the results of long years of study and endless experiments, and even if they cannot tell in scientific terms the reasons of the success or failure of their work, they are gaining a mass of information solidly and truly based.

Amongst the high-minded ladies of our own country there are many, we know, who lay the seeds of future good growths by encouraging domestic study, not under this name, but practically it is study of the best kind, and it is greatly to be wished their example were more followed, in all possible encouragement to the children to indulge in rational amusement and occupation of this kind. In the country household, under her mother's eye, the girl will gain the best kind of insight into garden, poultry-yard, dairy, and other domestic matters, which ultimately it will be very desirable she should be able to direct, and will probably retain the knowledge through life, with power to add to the foundation laid. Any amount of useful information is desirable on these subjects, and those who wish to see their children well trained in them will do well to begin early. We might hope then to find that, instead of there being any call for associations to be set on foot for the instruction of young ladies in domestic matters, the proposed pupils were for all practical purposes prepared for their work.

In many cases the study of botany, and of the principles of gardening is taken up by those who have no wish and no means for carrying on the practical application of the knowledge—in such cases the information is useful and improving simply for its own sake; but in the large amount of instances where practical knowledge would come, it may be said, almost of itself, by simply taking advantage of the opportunities around, it is earnestly to be desired that they should be fully utilised. *O.*

## LONDON MARKET PLANTS.

(Continued from p. 181)

### FINE-FOLIAGED PLANTS.

*FIGUS ELASTICA* (India-rubber plant), which is so much in favour for London, thriving where little else will do, is at Messrs. Beckwith's grown in quantity; 10,000 of it are yearly propagated, grown on, and sold; and about 1000 *Aspidistra lurida variegata*, quite equal to the last for keeping long in good presentable condition where few things can live at all. It is a plant always in demand in the market, but does not propagate so quickly as some things. Five thousand of the elegant Fern-like *Grevillea robusta* are annually raised from seed, and grown on to a height of about 15 or 18 inches before being sent to market. Of Ferns *Adiantum cuneatum* is the principal kind cultivated, and of this some 10,000 good-sized plants are kept to cut from—managed in the way that best suits buyers, by growing it in a manner to keep the pinnules small, so as not to hide too much the flowers with which it is arranged. A very large house is filled with *Crotons* and *Dracenas*: the leading kinds are *C. Weismanni* and *C. undulatus*—beautiful, well-furnished, highly coloured plants in small pots; the *Dracenas* are mostly confined to a few kinds, of which *D. terminalis* and *D. terminalis stricta*, amongst the coloured-leaved kinds, are the principal, and *D. rubra*, a plant that can scarcely be surpassed for general decorative purposes. About 2000 examples of the variegated *Cyperus alternifolius* are yearly got through. A very large house is filled with Palms of a useful size for ordinary use, some 5000 of these are the yearly complement; the main sorts grown are *Areca sapida*, *A. Baueri*, the different species of *Kentia*, *Latania borbonica*, and *Rhapis flabelliformis*.

### CHRYSANTHEMUMS.

In *Chrysanthemums* for cut flowers 16,000 pots, three plants in each pot, of the white Japanese variety *Elaine* alone are grown; and 20,000 pots, also three plants in each, of other sorts, the principal of which are *Mrs. George Rundle*, white; and the

two sports it has produced, *George Glenny*, primrose; and *Mrs. Dixon*, yellow; also *Madame Martha*, white. These are grown very strong and in large pots, so as to produce a plentiful crop of bloom.

### BULBS, ETC.

The number of bulbs forced could hardly be credited by those who have not an opportunity of seeing the quantities that are got through in the market and the vast number of shops where flowers and plants are sold in London and its suburbs. Tulips head the list with 100,000; the rose and the scarlet varieties of *Van Thol*, for cutting, are forced in boxes. The flowers are up and ready to sell in a fortnight after the bulbs are put in heat; mats are kept on the roofs of the houses where they are forced, to draw the stalks out sufficiently. These two varieties are the first in. Others grown consist of *White Pottebakker*, *Rose Grisdeline*, *Molière*, and *Tournesol*.

Twenty thousand *Roman Hyacinths* and forty thousand large-flowered kinds are annually disposed of, the former giving a supply up to the end of the old year, and the large-bloomed ones meeting them at the beginning of the new. The sorts grown are all single flowers, except one, *La Tour d'Auvergne*, white. They comprise *Homerus*, red; *Lord Macaulay*, red; *Amy*, red; *Grande Vedette*, white; *Charles Dickens*, blue; *Grand Lilas*, blue; *Alba superbissima*, white; *Mimosa*, purple, &c. They are mostly grown one bulb in a pot, and when well rooted are placed in heat, with a small handful of cocoa-nut fibre on the top of each, put so as to cover the blanched crown, which, growing through the material, thus becomes inured to the light. Sixteen thousand paper-white *Narcissus* are required. The space that such a number of bulbs occupy in boxes and pots needs to be seen to be fully understood. Six men do nothing else for two months but keep on potting and forcing, and when all plunged out-of-doors in their bed of cocoa-nut fibre, the extent is equal to that of a good-sized paddock. Ten thousand bulbs of *Lilium longiflorum* and its variety *eximium*, the latter much the best, are yearly flowered.

Five thousand *Hoteias* are forced; 4000 *Genista fragrans* were just moved into their blooming-pots—choice husky stock, that will make beautiful plants by the end of summer. This is a subject for which there is always a good demand.

### MANURE-WATER.

As might naturally be supposed, manure-water is largely employed here, as in all the market gardens. Without its aid it would not be possible to produce the comparatively large, fully-furnished plants, that are grown in the very small pots; the stimulant most used by Messrs. Beckwith is urine from the cowsheds; to obtain this, they arrange with some half-dozen dairymen in the neighbourhood to have it in an undiluted state, for which purpose a cesspool is made inside the sheds, the contents of which are removed once a week. For most things it is used at the strength of about a pint to 2 gallons of clean water; gross feeders, like *Chrysanthemums*, will bear it as strong as one part to six of water. I can speak confidently of this being the most effective of all liquid-manures, not only for soft-wooded plants, but also for all hard-wooded stove subjects and such of the cooler or greenhouse section as grow moderately fast. Its effects are almost magical, and have been found to be so by the many whom I have advised to try it; but it should be got in its pure state, not mixed with soakings from the manure-heap. What I have particularly noticed in connection with its use is that plants to which it is applied, either hard or soft-wooded, do not run to excess of leaf as they do when most other liquid stimulants are given, but have a disposition to flower almost in excess of the growth they make, although the latter is of the stoutest possible description. Neither do the plants show any inclination to stop after a time where it has been used, as is often noticed to be the case when other things of a highly stimulating nature have been given. Like everything else employed for a similar purpose, it needs to be used with care and discrimination so as not to give it disproportionately strong to the kind of plant it is applied to, and, what is of almost as much importance, its use must be regulated by giving more or less according to the particular stage of growth the plant is in. It is by attentive observation as to the treatment which particular varieties of plants require or can be made to conform to that the market grower's success more than that of the general cultivator depends, and it is frequently found that

some one or two out of hundreds of varieties of the same species are all that will bear such usage as will make their cultivation of any use for market purposes. *T. Baines.*

(To be continued.)

## PLANT THIRST AND ROOT REST.

NOTHING is more perplexing to young gardeners than the directions they receive as to the watering and the "rest" of plants. They are arts which cannot well be defined by set rule; like tailoring, as set forth by *Mr. Punch*, they have not as yet become exact sciences. There are many facts connected with Nature's way of watering and of resting which deserve more attentive notice than they usually obtain. For example, the herbaceous plants, bulbs, tubers, and deciduous trees of the fields and hedges are bounteously supplied with root moisture during the coldest part of the year. Earth Orchids, *Scilla nutans*, *Ornithogalum*, and *Fritillarias*, commonly supposed to be at rest, are deluged with rain or melting snow; the vernal *Crocus*, so abundant in the Trent meads near Nottingham, is frequently under water for months together. In a similar manner the large-flowered *Cape Disa* is not unfrequently submerged, and *M. Roehl* dug some of his American Lilies from the bed of a stream where at times they must have been entirely flooded.

In Europe we have noticed that many plants, although common to the breezy down or open meadow, yet attain their stateliest and best proportions of leaf and blossom when growing in swampy ground beside a brook or ditch, or in wet woods. Shade, shelter, and leaf-mould may do somewhat towards luxuriance in the woods, still it is remarkable that a liberal supply of root moisture, even in shady places, does much towards increase of vigour. On sewage farms results are attributed to manurial stimulants without due allowance being made for the extra water supply also used on them. In temperate countries Nature never "dries off" her bulbs and tubers in winter, but in the summer and autumn, just as their growth ends in blossom and in seed. So in the tropics, plants grow most during the coolest and wettest part of the year—the spring and summer of the equator; but during the hottest and driest portion of the year—the autumn and winter of the tropics—they rest, although it should be observed that all over the world of Nature plants really rest far less than is generally supposed. The plants which really cease growing in leafage and root at the same time are comparatively small in number. Decrease of temperature rather than decrease of root moisture is her plan of inducing leaf rest in cool countries, as *Water Lilies* and other aquatics bear witness. Root rest is induced by heat and drought. Thus in the equatorial tropics root rest is induced by the heat and drought of the hot monsoon, but leaf rest is only partial, nearly all plants there being evergreen, a state of things rendered possible by the copious dews of night. In temperate countries cold and drought may have a similar effect, in so far as the temporary arrest of root-growth is concerned, but it is very slight, and that it is so slight is owing to the moisture in the earth during winter.

One important fact for gardeners is that the epochs of leaf-growth and of root-growth are, in a way, distinct. Thus in the case of hardy bulbs and herbaceous plants we find the roots active all through the mild weather of winter. We repotted some bulbs of *Lilium speciosum* two months ago just as the leaves fell from the old flower-stems, and to-day, January 23, the new soil is full of thick white roots. We have followed Nature in keeping the earth wet, and the results gained are thus far the same; for we referred to some bulbs growing in the open border, and find that they likewise had long ago begun their work. That the epoch of root-growth should also be of much longer duration than that of leaf-growth is also instructive, and especially to those who have been taught to "dry off" bulbs or other herbaceous plants in pots as soon as the leaves fall off. This practice, often spoken of as "resting" plants, too often means a course of starvation. As a rule, plants may be best "rested" by a cool temperature rather than by drought at the root. Thus, when Orchids are "rested" in a high temperature, and dryness at the root induces shrivelling of the pseudo-bulbs, we know that instead of the plants being "rested" they are actually being starved.

Again, if bulbs are rested by "drying off" let it be done only at the juncture when the old roots naturally decay and before the young roots are visible, and even then let coolness and moisture rather than heat and aridity be employed. Loss of weight and substance, as represented by shrivelling, must be put down as the result of too much heat and dryness. It is singular to observe how little drought is feared by those who are nervous about low temperatures, and "Jack Frost" is far more often blamed for lowering the thermometer rather than for his rabid moisture-licking propensity. We shall do well to consider whether the drought induced by frost is not more fatal to hardy plants than any degree of abstract cold. Eastern Nelumbiums and aquatic plants from South Africa are hardy at Paris and elsewhere in France, although the frost is there more severe than in England. It has been pointed out that a very slight covering will "turn" many degrees of frost, not so much by sheltering plants from the frosty air directly, as by preventing radiation or heat and moisture leaving the ground. Moisture and frost are to a certain extent antagonistic, and we have saved many tender bulbs and alpine plants from injury during sharp weather by the simple practice of soaking the ground around them with water, and then giving them a covering of wet leaves or a hand-light, and this as a protection from drought rather than against cold.

We read quite recently of an Orange orchard in California having been saved from frost by an accidental irrigation of the soil; surrounding orchards on dry land perished completely, root and branch. We all know that irrigated meadows produce twice as much grass as others not so plentifully watered, and some of our most successful Peach and Grape growers are among those who realise the magic of heavy waterings. It has been said that, "all other things being equal, the man who uses most water is the best gardener"—a saying in which there is much, if not the whole, truth. Good potting, ample drainage, &c., are of course here presupposed. In our practice of gardening we are still much too empirical. The thermometer is to a certain extent employed—we do measure our heat, however rudely—but the hygrometer is rarely to be seen, so that atmospheric moisture is to most of us a matter of "rule-of-thumb" or chance. The third factor, light, is still more rudely handled; nothing sufficiently simple and efficient has yet been devised to measure its intensity for us, so that its effect in practice may be said to be unregistered, indeed almost unknown, on any particular plant. That some Ferns become of a deeper green hue, and Grapes of a better colour, when heavily shaded, and that some flowers become much brighter in tint when fully exposed, seems to point to its having varied phases of action. There is here an unworked field, and we await with something akin to impatience for our Crooks or Edisons to devise an instrument which will measure the intensity of light as readily as the thermometer and hygrometer measure our heat and moisture. *F. W. Burbidge.*

## MALAYAN FRUIT.

THE illustration of a collection of Malayan fruit, which we give on p. 209 (fig. 38) was engraved from a photograph kindly furnished by Mr. A. T. Sibbald, who sends the following notes relating to them.

### THE DURIAN.

Two fruits, one entire, the other separated into its constituent valves, are shown in the background of the illustration. There are several varieties of the Durian, only differing from each other by the shape and size of the fruit. The fruit is well known from the description of travellers. It is about the size of a man's head; outside is a thick prickly husk, in the inside chambers of which lie the sections of the fruit, consisting of a number of seeds of about the size of a Walnut, surrounded by a soft, pulpy substance, like custard in appearance, which is the only edible part.

The taste of the fruit it is impossible to describe, but the smell of it, from which the flavour may be judged, is such that no gentleman in England would care about having one in his house. The Malays and natives generally are passionately fond of it.

With Europeans the liking for it is, I think, in all cases acquired; the first venture is generally made in bravado, and so singular is the fascination it possesses that if the new arrival can overcome the repugnance

sufficiently to swallow the coating of one or two seeds, he will in all probability become strongly attached to it.

From Rumpf's account we learn that in order to try whether a Durian fruit be ripe for eating the connoisseurs usually tread upon it with their foot; if ripe it gives way in five places by as many natural fissures, which exhibit five cell-compartments. The Durian, of which there are two crops a year from the same tree, are mostly plentiful in June and July, and in December and January.

### THE MANGOOSTAN, OR MANGIS.

Sion House is the only place in England where the Mangoostan has ripened and borne flowers. The tree is a native of the Moluccas, and its cultivation has extended to the Malay Archipelago, beyond which it would appear that all attempts to grow the tree well, and mature the fruit, have been hitherto unsuccessful. From the earliest accounts we have of this charming tree and delicious fruit, we learn that the innumerable attempts hitherto made to familiarise it to other countries (than the Malay peninsula and islands eastward to the Bay of Bengal) have proved unsuccessful. Two entire fruits are shown in front of the spiny Durian, and others cut open are shown in various places. It is of the size of a small Orange, is when young of a reddish-green hue, when ripe of a reddish-brown, and when old of a chestnut-brown colour. Its succulent rind is nearly the fourth of an inch in thickness. It contains a very powerful astringent juice, and in wet weather exudes a yellow gum which is a variety of gamboge. On removing the rind its esculent substance appears in the form of a juicy pulp, having the whiteness and solubility of snow, and a refreshing delicate delicious flavour.

From its perfect wholesomeness it may be eaten in any quantity, and as it possesses no luscious qualities it does not soon cloy the palate. It is not a little singular that a plant nearly allied to the Gamboge should yet yield so wholesome a fruit. The Mangoostan is most plentiful in December, January, and February; but it can, together with the Durian and Rambutan, be obtained in any month of the year. So great is the uniformity of the temperature and the climate of the Straits of Malacca that even Nature there neglects to mark the passing year by the usual distribution of her gifts.

### THE RAMBUTAN.

The fruit of *Nephelium lappaceum*—the name being derived from "rumbut," which means in Malay the hair of the head, in allusion to its villous covering on the outer skin; it is in appearance not unlike the fruit of the Arbutus, but larger, and of a bright red, and covered with a coarser hair or soft spines. It is shown in the foreground of the illustration. The part eaten is a gelatinous and almost transparent pulp surrounding the kernel of a rich and pleasant acid.

### THE CUSTARD-APPLE.

The Siri Kaya, or Custard-apple (*Anona squamosa*), derives its name from the likeness which the white and rich pulp bears to custard. The Nona, as it is called by the natives (*Anona reticulata*), is another species of the same fruit, but not so grateful to the taste.

## PLANT PORTRAITS.

APPLES, *Herefordshire Pomona*, part ii.—The following varieties are beautifully illustrated:—t. vii., Blenheim Orange; t. viii. and xi., various cider Apples; t. x., Pott's Seedling, Tower of Glamis, Gloria Mundi, Winter Hawthornden, Nelson's Codlin; t. xii., Emperor Alexander, Cox's Pomona, Cellini, Beauty of Kent; t. xiv., Scarlet Pearmain, Adams' Pearmain, Hereford Pearmain, Lamb Abhey Pearmain, Mannington's Pearmain, and Winter Pearmain, or Duck's-bill.

AZALEA DUKE OF CONNAUGHT, *Floral Mag.*, t. 378.—Flowers, hose-in-hose, bright rosy-cerise, a cross between *A. amœna* and one of the finest of the garden varieties. A pretty and useful novelty. Mr. B. S. Williams.

BEGONIA J. H. LAING, *Floral Magazine*, t. 375.—Flowers large and stout, orange-scarlet, good form. Laing & Co.

BEGONIA SCHMIDTIANA, Regel, *Gartenflora*, t. 990.—A Brazilian species, with obliquely cordate, ovate acute leaves, dark green above, vinous-red beneath, with nerves depressed above, prominent

beneath; flowers small, white, in loose drooping panicles.

BEGONIA TEUSCHERI, Hort. Linden, *Illustr. Horticole*, t. 358.—A supposed species from the Dutch Indies, with cordate ovate acute leaves, olive-green above, and marked with spots and blotches varying greatly in size and arrangement in different seedlings, the under surface rich claret-coloured. The flowers are not yet known.

BOLLEA CELESTIS, Rehb. f., *Bot. Mag.*, t. 6458: see *Gard. Chron.* 1876, p. 756, and 1877, p. 366.

BROWNEA ARIZA, Benth., *Bot. Mag.*, t. 6469.—A splendid stove shrub, with large heads of brilliant scarlet flowers. Native of New Granada. The specimen figured flowered at Glasnevin.

CARLUDOVICA WALLISII, Regel, *Gartenflora*, t. 992.—A glabrous dwarf species, with broad ovate leaves, acute at the base, and with two acute lobes at the apex.

CHORISOPORA GREIGI, Regel, *Gartenflora*, t. 984. CLOVE SUSAN ASKEY, *Floral Mag.*, t. 380.—A most desirable variety, flowers large, good in shape, rich in perfume, pure white in colour.

COLEUS TRICOLOR, *Floral Magazine*, t. 376.—Leaves with a maroon ground, spotted and margined with green, disc and veins carmine.

ENKYANTHUS HIMALAICUS, Hook. f. and Thoms., *Bot. Mag.*, t. 6460.—Flowers in terminal umbels, pedicels reflexed, corollas  $\frac{1}{2}$  inch long, bell-shaped, five-lobed, five-angled, yellowish-red with reddish streaks. Bhotan, Sikkim. *Bot. Gard.*, Edinburgh.

ERANTHEMUM ANDERSONI, *Floral Mag.*, t. 377: see *Gard. Chron.* 1869, p. 139.

GENTIANA KURROO, Royle, *Bot. Mag.*, t. 6470.—A beautiful dwarf Himalayan Gentian, with large funnel-shaped azure blossoms sprinkled with pearly-white. Flowered by Mr. Bull. One of the most beautiful of rock plants.

HABERLEA RHODOPENSIS, Frivaldsky, *Gartenflora*, t. 992.—A singular and beautiful dwarf Gesnerad, the only European representative of that family, and one of a group including *Ramondia*, *Wulfenia*, &c., very remarkable, as we have before had occasion to note, in their geographical distribution.

MASSEVALLIA IGNEA, VAR. BODDERTII, *Illustr. Horticole*, t. 357.—A variety with rose-coloured sepals spotted with white, and with a yellow throat. M. Linden.

NARCISSUS PALLIDULUS, N. GRAELLSII, N. RUPICOLA, *Bot. Mag.*, t. 6473.—The first-named is the *N. triandrus* of Baker, *Gard. Chron.* 1869, partly. It has pendulous, greenish flowers, with deep cup-shaped corona and reflexed segments. *N. Graellsii* has sulphur-yellow flowers, with large, whitish, funnel-shaped corona, and small deltoid lanceolate segments. *N. rupicola* has small flowers with ovate lemon-yellow segments, and a shallow orange-yellow corona of six spreading lobes.

PACHYSTOMA THOMSONIANUM, Rehb. f., *Bot. Mag.*, t. 6471.—A very remarkable West African Orchid, figured and described in *Gard. Chron.* 1879, ii., 582.

PEARS, *Herefordshire Pomona*, part ii.—The following varieties are beautifully illustrated:—t. ix., Forelle, Louise Bonne, Williams' Bon Chrétien, Beurré d'Amanlis, Flemish Beauty; t. xiii., Pitmaston Duchess, Beurré Hardy, Doyenné du Comice.

PICOFEEES, *Floral Magazine*, t. 374.—The varieties figured are—1, Mrs. Payne; 2, Queen of Summer; 3, Mrs. Chancellor. C. Turner.

POLYGONUM AFFINE, Don, *Bot. Mag.*, t. 6472.—A pretty Polygonum of the Bistort section, closely allied to *P. vacciniifolium*, and commonly known as *P. Brunonis*. Native of Himalayan valleys.

PRIMULA STEINII ×, Obrist, *Gartenflora*, t. 991.—A dwarf tufted species, with spatulate, toothed leaves, and rosy-lilac flowers. It is supposed to be a natural hybrid between *P. hirsuta* and *P. minima*. Native of the Tyrolean Alps.

ROSE BOUQUET D'OR, Ducher, *Belgique Horticole*, 1879, t. xv.—A Noisette of great beauty, habit good, like that of Gloire de Dijon; flowers large, open yellow, with various shades of orange.

ROSE DUKE OF TECK, H.P., *Floral Mag.*, t. 379.—A fine seedling from Duke of Edinburgh. Flowers bright crimson-scarlet. Messrs. Paul & Son.

SOLANUM TORREYI, Gray, *Bot. Mag.*, t. 6461.—A very handsome hardy Solanum, more or less prickly; leaves reddish on the under surface; the flowers are large, purple, rotate. Kew.

TULIPA TRIPHYLLA, Regel, *Bot. Mag.*, t. 6459.—One of Dr. Albert Regel's discoveries in Central Asia. The flowers are small and yellow, like those of *T. sylvestris*. Kew.

## HANDCROSS PARK.

HANDCROSS PARK, the seat of J. Warren, Esq., is situated not far from the pretty village of Crawley, in Sussex. Of late years much has been done here in gardening and the general improvement of the property. The surrounding country is somewhat flat and wanting in the effect present where hill and dale exist with their ever-varying relief, which affords such advantages to the judicious planter. Yet the grounds within themselves present considerable inequality of surface, which has been turned to the best account. I believe that from the time Mr. Warren acquired the property it had been his fixed intention to lay out the grounds, which included the making of a new garden, with the necessary accompanying glasshouses, as well as a homestead to meet the requirements of a moderate sized farm, stables, &c. The works connected with these various objects have been carried out during the last four or five years, and I understand that the new mansion that is to take the place of the present house is now to be commenced.

Before speaking of the garden it will be well to say a few words about an important portion of the grounds, some 150 acres in extent, to which a good amount of work has been done, but which nevertheless remains much in the state that Nature has left it, with groups of self-sown Scotch Pine and Silver Birch scattered at intervals over the Gorse and Heather-clad surface. The land, although clothed with this kind of vegetation, where not already dry enough has been made sufficiently so; broad, well made grass walks some miles in length have been introduced, yet so arranged that they have not an unmeaning appearance or one calculated to destroy the individual character of the whole. The soil is evidently suited to the growth of Coniferous and Taxaceous trees, and thousands of all the best species and varieties of these have been planted, the majority of them selected examples of their respective kinds. The most suitable positions have been chosen for the disposal of these trees, round the outer portion of the space, in groups and masses, so as not to interfere too much with the natural character, which it is intended to preserve. In the inner portion of the grounds on the sides of the walks, where admissible, quantities of the best evergreen trees of recent introduction have been planted, mostly in pairs, to match, and which, when time has enabled them to exhibit their natural forms, will constitute an important feature of the place. All the best Hollies have alike been employed, and large masses of the best sorts of Rhododendrons have been brought into requisition, which are thriving, as might be expected, in the virgin peat. A stream of water which winds its way through the lower part of the grounds has been taken advantage of. The natural kinds of Heath growing here have been supplemented by the best hardy cultivated varieties.

In the park are some exceptionally fine trees, mostly Beech, with thick gnarled old trunks and immense heads. The largest measures some 21 feet round at 4 feet from the ground, the spread of its branches being 95 feet; another is 18 feet in girth, and several others are but a little less: some of them have been pollarded at an earlier period of their existence, and they are now as healthy and vigorous as could be desired. It is not easy to account for these trees having attained the size they have, as, so far as I have had an opportunity of judging of timber in this part of the county of Sussex, trees of any considerable size are more the exception than the rule.

The new garden was begun some five years ago. It is of medium size, and enclosed by excellent walls 12 feet high, with buttresses at intervals of about 28 feet. Each buttress is carried up to a point some 2 feet above the top of the wall, they thus give relief to the otherwise continuous straight line. These walls have full projecting coping, and are planted with Peaches, Nectarines, Figs, Cherries, Plums, and Pears. On the south, east, and west sides of the garden is a slip with a 15 feet fruit border next the wall, at the foot of which is a broad walk; on the opposite side of it is a border, down the centre of which is a row of dwarf fruit trees, the whole enclosed by a handsome Holly hedge kept low enough not to intercept light and air. We often hear people objecting to plant this, the best—as well as the best looking—of hedge plants, on the plea that it takes long to make a fence: but if proof be wanted that with the use of good, well-prepared plants, the ground

properly prepared, and the after attention equal, it does not take long to get up a Holly hedge sufficient as a fence to turn cattle if it were in a position to be required to do so.

The inner portion of the garden is well stocked with fruit trees on the margins of the intersecting walks just coming into a nice bearing state. There is a range of five houses, four hip-roofed, the central one dome-shaped, in the inside of this garden, facing south. The first is filled with Peaches, strong trees, in very good condition; the second is almost wholly occupied by Crotons, which plants Mr. Warren is very fond of, and here may be seen what we doubt not to be the most complete collection of fine established specimens of this favourite group in existence. Amongst them are examples of *C. majesticus*, 5 feet by 5 feet; *C. interruptus*, 7 feet by 7 feet; *C. Youngii*, 6 feet by 5 feet; *C. Andreanus*, 5 feet by 5 feet, large leaves, very finely coloured; *C. Hendersoni*, 4 feet by 4 feet; *C. trilobus*, 5 feet by 4½ feet; *C. Weismanni*, 5 feet by 7 feet; *C. Williamsii*, 3 feet by 2½ feet, one of the best of the large-leaved varieties; *C. princeps*, 2½ feet by 2½ feet, one of the best of the newer kinds, intense crimson covering two-thirds of the leaf; *C. picturatus*, 2 feet by 1½ foot; *C. triumphans*, 2 feet by 1½ foot; *C. Challenger*, 3 feet to 1½ foot—immense leaves, 18 inches long by 4 inches wide, vivid crimson midrib, about half the surface yellow, turning when older to crimson; *C. chrysophyllus*, 2½ feet by 2½ feet, one of the neatest for table decoration, in small plants with single stems; *C. Queen Victoria*, 2 feet by 1½ foot, leaves intermediate in both form and size between *C. Weismanni* and the old *C. variegatus*—four-fifths of each leaf is of the brightest golden-yellow, changing when older to red with vivid crimson midrib; *C. Prince of Wales*, 3 feet by 2½ feet, very large, long drooping leaves, 20 inches in length and 2 inches wide, half the surface of the leaves yellow; *C. volutus*, 4 feet by 4 feet; *C. Cooperi*, 4 feet by 3 feet, a distinct large-leaved kind; *C. angustifolius*, 5 feet by 5 feet; *C. undulatus*, 6 feet by 5 feet. There are other varieties in addition to the above associated with them, but they are either inferior to those I have named, or have not arrived at a condition such as to show what they are likely to be, but altogether they are a very handsome and interesting house of plants.

The centre house in this range has a dome-shaped roof, and is filled principally with Palms and Tree Ferns, the most noticeable of which are *Pritchardia pacifica*, *Areca sapida*, *Latania borbonica*, *Kentia australis*, *K. Belmoreana*, *Areca Bauerii*, *Phoenix sylvestris*, *P. tenuis*, *Chameroops tomentosa*, *C. gracilis*, *C. humilis*, with a clean stem 8 feet high; *Cycas revoluta*, 12 feet in diameter. The whole of the above plants are large and in grand condition, several of them having often done good service in helping Mr. Rann to take the first prizes at the principal London and other exhibitions, where of late years he has been so successful. The adjoining two houses are occupied by Agaves, Bonapartes, and other succulent plants, quaint in their appearance, but always interesting to those who can see something in plants beyond the mere colouring of their flowers. Here was a fine example of the scarce glaucous variety of *Dasyllirion*, bearing a flower-spike 10 feet high (see fig. 37)—a singular production, in form not unlike a gigantic spike of *Celosia pyramidalis*, but less feathery, of an indescribable silvery-grey colour; the inflorescence when fully developed has a most remarkable appearance, conveying an idea of transparency such as occurs in the Ice-plant (*Mesembryanthemum crystallinum*).

The first in another range of very good span-roofed houses is almost filled with specimen and half-specimen Azaleas, including most of the best sorts. The plants are in excellent health, densely clothed with healthy leaves which show by their green state that they have not suffered from their insidious enemies, thrips and red-spider. The centre of the next house is devoted to Camellias, and a wide front stage is occupied with a selection of Ericas and other hard-wooded flowering plants, consisting of *Aphelexis*, *Boronias*, *Statice*, *Hedaras*, &c.

The adjoining division in this range is similar in size to those already mentioned, and is principally occupied by Ferns, including a number of large specimen *Gleichenias* not by any means strangers in the winning groups of Ferns at the principal shows. Amongst them are beautiful specimens of *G. rupestris*

*glaucescens*, *G. speluncea*, *G. microphylla*, and *G. Mendelli*, ranging from 4 to 7 feet in diameter. The last house in this range is used as a stove, in which are fine specimen plants of *Zamia Lehmanni*, *Cycas circinalis*, *Ixoras*, *Dipladenias*, *Clerodendrons*, *Bougainvilleas*, and a splendid specimen of *Anthurium Scherzerianum*. In these low hip-roofed houses is located a collection of *Dracenas*, comprising the best of these handsome fine-leaved plants, and a small select collection of Orchids.

The kitchen garden bears evidence of the great difference that soil and situation exert over certain crops. In many places do what you may it is impossible to keep Peas from mildewing after August is out, but here they go on bearing until killed by frost. Last year Mr. Rann was able to gather Peas up to November 25, and when I saw them in the last week in October several long rows of Williams' Emperor of the Marrows were as green and full of pods and bloom as we usually meet with them at midsummer.

The place, both outside as well as the plants in the various houses, is in excellent keeping, and reflects favourably upon Mr. Rann's care and abilities. One of the great wants felt in many places is a sufficient supply of water. To meet this Mr. Warren has made such provision as has incurred a large expenditure by sinking a deep well, with a steam-engine to pump, and a tower 80 feet high, built of red brick, with white York stone dressings, with tank at the top, which holds 10,000 gallons. The building is of a decidedly decorative character, combining use and ornament, and is a very commanding object, with plenty of room all the way up to do something more than simply supply water. The principal apartment on the basement story is fitted with a circular saw, for cutting up timber; the next above contains a corn-crushing mill and root-pulper; then come two excellent store-rooms, one over the other; and above them the tank, covered in and surrounded with a turreted wall, from within which a fine view of the surrounding country is to be had, the whole being reached by a handsome winding staircase.

The farm buildings, enclosing a square of considerable size, are of the most complete description, substantially built, with everything that could be suggested for convenience, yet there is an absence of the useless that is often seen in what are looked upon as model arrangements of this kind for farm purposes. It is no uncommon occurrence to see every provision made for the health and well-being of the quadruped portion of an establishment, with so little done for the bipeds that have to look after them that they would seem to be all but out of the calculation: this is not the case at Handcross Park. Mr. Rann's house, built when the new works were commenced, is one of the best, as well as best looking, gardener's houses I have seen; others are about completion for the men employed on the farm, and one for the young men in the garden, all of which are not only much more attractive in their exterior, but have such conveniences for the occupants as are rarely met with.

A considerable portion from the uncultivated land was reclaimed about five years ago, and is now arable. At the time of my visit in the autumn part of it was bearing, for the season, an excellent crop of roots, in the cultivation of which Mr. Rann, who, in addition to the garden, has charge of the farm, is very successful, having taken several cups at the district agricultural show. *T. Baines*.

## Florists' Flowers.

SEASONABLE NOTES ON GREENHOUSE FLORISTS' FLOWERS: AZALEAS.—The forcing of these to keep up a display of beautiful flowers from March onwards till July is comparatively easy when proper appliances are provided, that is, forcing houses where the plants can be specially treated as regards heat, moisture, &c. Usually the only available space is to be found in vineries or other forcing houses. Under such circumstances it is quite necessary to have the plants quite free from thrips; very often they get from the Azaleas to the Vines, and do much damage before they can be destroyed. Fumigate well before the plants start to make new growth. See that they do not want for water at the roots, and syringe overhead once every day at least.

## BOUVARDIAS.

These ought certainly to be placed into heat now, if this has not been already done. Water freely at the roots, and syringe to cause a good "break."

When the plants were placed into heat about January 1 or earlier cuttings can now be obtained. They should be taken off as soon as they are ready and be potted in 4 or 5-inch pots, about nine or

on a shelf near the glass in the same temperature as the cuttings.

CALCEOLARIAS.

If the plants intended to flower for exhibition

the pots are well filled with them. Some of the old growers used to syringe overhead, but I never allow water to fall upon the leaves at any time. The difficulty has been in such a winter as this to keep a moist genial atmosphere, owing to the excessive use of the heating apparatus. It has been necessary to wash the outside of the glass many times this season; as I write it the coating of deposit left by the fogs of the last days of January is thicker than any that has preceded it, and we are again busy washing the glass.

CINERARIAS.

We have no more valuable plants than these to place into the greenhouse as soon as the Chrysanthemums are over. Plants that were in flower at Christmas are still in full beauty; indeed, they have improved since these others are rapidly succeeding them. All these early flowering plants succeed quite well in 6-inch pots. Fumigate occasionally to destroy greenfly, which will persist in establishing itself amongst the yet unopened flower-buds. It is not too late yet to repot the latest flowering specimens; the largest plants should be grown in 8-inch pots. Continue to tie out the young shoots as they require it, and manage so that the plants are dwarf and the leaves hanging well over the sides of the pots.

CYCLAMENS.

If seeds of these were sown as recommended early in January, and the pots or pans placed in a temperature of say 55°, the plants will now be coming through the ground. They do not appear with two seed-leaves opposite each other, like many other plants; a single leaf is pushed up, and as soon as a second one is seen the plant may be taken out with a pointed stick and potted in fine soil, using a thumb-pot for each plant. Let the pots be placed on a shelf near the glass in the same house. Such plants, if well attended to and potted on as they require it, will produce from twelve to twenty-four flowers within twelve months.

HYACINTHS.

We do not care to get these too early into flower, but those that were placed in the forcing-house early in January are now making good growth, and the spikes are good. They require to be supplied with weak liquid-manure at each alternate watering. Those intended for exhibition are now on shelves near the glass in a heated pit. They will require more forcing this year than usual, as they are not so far advanced now as they have sometimes been at the same date in January. The bulbs have formed very few roots; this, too, is owing to the low temperature of the material in which they had been plunged. It is very desirable to use tepid water for the supply of the roots. Keep the plants near the glass, and admit air freely in the early stages of their growth.

LARGE-FLOWERED PELARGONIUMS.

The large specimen plants intended for exhibition will require looking over almost daily. Tying out the young growths must be seen to as they become crowded, and no plant must suffer for want of water. The early flowering plants will now have filled with roots the pots in which they are blossoming, and will take up more and more water as the days lengthen. See that each plant has a thorough watering when it requires it. Give enough to moisten every part of the ball of roots. The Pelargonium Society gives prizes for plants in 6-inch pots, and it is highly desirable that these should be encouraged. When the plants are well managed it is astonishing what an excellent effect can be produced by their being arranged in the greenhouse; and the flowers from young plants are produced in succession, giving an abundant supply to cut from. The latest flowering plants may yet be potted, the operation to be performed as previously advised. Still fumigate to destroy greenfly: the importance of keeping the plants free from insect pests can scarcely be over-estimated.

FANCY PELARGONIUMS.

This very pretty section of the great Pelargonium family has been too much neglected lately. The craving is for some new thing; and if it were not for a few enthusiasts who cling to their old loves "through December's snow and July's pride," many choice plants would be lost. The large bushes of the above I do not like so well as neat little specimens in 5 or 6-inch pots; they are quite charming placed close to the front of the stage in the greenhouse

FIG. 37.—DASYLIIRION GLAUCUM, MUCH REDUCED. FLOWER, AND SECTION THROUGH OVARY, MAGN. (SEE P. 204.)

twelve in each, using fine sandy loam on the surface. Place the pots containing the cuttings in a nice bottom-heat, with a temperature in the atmosphere of 55°. Old plants may be shaken out of their pots, reducing the ball of earth considerably, and repotting in a size smaller pots. These old plants will do well

purposes in June have not yet been potted into their flowering pots, no time should now be lost in doing so. After this the plants commence to make very rapid growth, and none more quickly show the effects of any check. The plants are very impatient of the lack of water at the roots, and more so when

or conservatory. The treatment is the same as that given last month.

#### ZONAL PELARGONIUMS.

Plants produced from cuttings put in last autumn have now made good growth in a house where the temperature has been about 45° during the winter. They are now in 3-inch pots, and as these are well filled with roots the plants will be at once repotted, the largest into 6-inch, and the smaller sizes into 5-inch pots. I do not approve of over-rich soil; good turfy loam six parts, one part of leaf-mould, and one part rotten stable-manure. When the proper compost has been obtained it is well to keep to that, as it is easy enough to make it too rich, which will produce a gross watery growth. Better to have the soil too poor than too rich, as the quality of the flowers can be improved by liberal supplies of manure-water. Large specimen plants require a more liberal diet than small ones.

#### PETUNIAS.

If cuttings were put in as advised last month, they will now have formed roots, and may be potted off at once into small pots. This is a rapid growing plant, and is very easily injured if it receives any check to its growth. An over-dry state of the roots means a number of the old leaves becoming yellow and requiring to be removed: I would not place the young plants in quite a cool house, but they may be placed there when well established. The plants require careful handling, as the glutinous leaves very readily snap off. The points must be pinched out of the young plants as soon as they begin to grow.

#### VERBENAS.

These are very liable to be attacked by insects, and the spores of mildew find a congenial resting-place on the leaves. Fumigating and dusting with sulphur must be persevered in until the plants are made quite clean. Early struck cuttings produce the best plants, and the treatment of them is exactly the same as for Petunias. Both like rich rather light soil and plenty of light and air. *J. Douglas, Loxford Hall.*

## Garden Operations.

### KITCHEN GARDEN.

**WINTER GREENS.**—The consequences which follow in the wake of extraordinary seasons like the one from which we are now escaping, should not be permitted to pass away without its lessons being turned to profitable account. In the vegetable department it may in this way be applied to the subjects in question, inasmuch as these naturally have to endure the full force of the frosts without any protection whatever, and the consequences are this season so plainly manifest, that it needs but little discrimination to decide which are the best kinds of winter stuff, and that it is on Brussels Sprouts, Cottagers' Kale, and the Savoy class that we must mainly depend for our supplies, when the season proves to be more severe than ordinary. For this reason we take advantage of existing circumstances to inculcate the real necessity to cultivate in every garden every year a proportionate quantity of these special subjects, as a means of meeting a similar and possible contingency. In singling out these kinds from the rest we by no means wish to imply that these alone are to be cultivated, because there are others possessing merits which should cause them to be grown likewise, although they are liable to be almost, if not quite annihilated occasionally. These include that old and invaluable subject, Purple Sprouting Broccoli, which in point of excellence is not surpassed. Chou de Milan is also another useful kind of greens, commendable on account of its coming in late, and so forming a connecting link between the kinds already mentioned, and the early crop of Cabbage. Scotch Kale is also to be recommended for late use, and for this purpose it should occupy a north border; while for garnishing or eatable purposes Melville's Variegated Kale yields a diversity of beautiful forms of this character.

The cultivation of the whole of this section of Winter Greens is similar in regard to details; they all require really good ground to do them creditably, and to occupy open spaces, with fair distances between the plants. These are the means to employ to build up a robust and hardy constitution, and qualify it also to endure the effects of frost and

the inclement conditions, which in due course it will most assuredly have to meet.

Of the subjects mentioned we consider that Brussels Sprouts occupy the first place as to importance and general usefulness; because they scarcely can fail to produce an abundance of sprouts, since they grow for a longer period than any of their contemporaries; and for this reason we usually plant "comparatively" a double quantity of it. In the first instance we sow the first week in February, and on this occasion we form a bed on a south or east border, margining it with a single row of bricks, the size being proportioned to the sashes we intend to employ to cover the space on which the seed is to be sown. When this is done, it is properly covered in and watered; if necessary the lights are laid on and kept closed until such time as the seed germinates, when air is given as required, and coverings at night applied when necessary. As soon as the plants are fit they are pricked out in a similar place until they are ready for the final remove to where they are to remain. We also sow at the same time, and under the same conditions, enough seed to obtain a supply of plants of Cottagers' Kale for the early breadth of planting, as this is undoubtedly the best of all the curled sorts of winter greens. The next or general sowing of the same kinds and all others of this section which we propose to grow, is made in the first week of March, on an open space of ground out-of-doors. In the case of the Savoy class we make subsequent sowings about the middle of April, and again at the commencement of June, this for the purpose of ensuring a successional supply in a perfect state, both as regards the condition and also the quality of the head.

The propitious change in the weather will be welcomed for out-of-door operations, as many of these, owing to unfavourable conditions, are much in arrear. At the earliest date possible sow Brussels Sprouts and Cottagers' Kale in the manner above described; also Cabbage, Cauliflower, Leek, and Lettuce seed, in the same way, or otherwise in very sheltered places in the open ground. Sow Parsley, as well as Peas and Beans, to succeed former sowings. In order to guard against the depredations of birds and insects, frequent attention will be needed as a means of protection to early Peas; we find Hornbeam or Beech twigs with the leaves adhering most useful. Any preparations which are not completed, which will be necessary on plots of ground intended for Onions, Carrots, Parsnips, &c., should be attended to as soon as the soil will admit, so that whenever a favourable opportunity happens the seeds can be got in expeditiously: the same remark is also applicable to ground intended for early Cauliflower and Cabbage plants. The Cauliflower plants, such as we referred to in a former Calendar, p. 58, are already planted in the places then described, and Cabbage plants which were pricked out into beds last autumn are likewise removed to the plots provided for them. *G. T. Miles, Wycombe Abbey.*

### FRUIT HOUSES.

**PINES.**—When fermenting beds are employed as a medium of giving warmth at the roots of these plants, it is a usual practice to replant and make up such beds just prior to the approach of winter, and to incorporate the materials employed in a manner so as to make the heat which is generated by them as steady and as durable as possible. In the ordinary course these beds will again require attention in this way, and should be renewed or refreshed by new material as soon as circumstances will permit. These matters can in some instances be carried out under any conditions, but as a rule they can generally be done most expeditiously when these are most favourable, and therefore advantage should be taken of such opportunities. At about the end of the current month we periodically start a batch of suckers, and give the requisite attention which is usual in this department to any other plant which requires it, as repotting or otherwise, shifting into larger pots any which may require it; for these requirements timely preparation should be made by having the soil and other requisites which are necessary in a fit state by the time they are wanted. Much of this kind of work can be accelerated at times when other work cannot be proceeded with. It is of the highest importance in potting these plants to have the compost in a proper state, and especially so when loam of a tenacious nature, such as we employ, is to be used. The help which we gain from more light and sunshine will speedily tell on the plants by exciting growth in them more quickly. When this is apparent a slight rise in the existing artificial temperatures may be tolerated. Where fruiting plants and others just coming up are located, strive to secure an invigorating state, not only by giving every attention to the moisture that is needful, but also by taking advantage of every gleam of sunshine that exists to keep the temperature in such places up to the maximum point, 90° or 95°; and also by closing up the house early in the day whenever the sun's influences can be

made instrumental for the same purpose. *G. T. Miles, Wycombe Abbey.*

### VINES.

When all the Grapes on early pot-Vines have been properly thinned, the laterals behind the bunches will require moderately close stopping, while those in advance of the fruit may be allowed more freedom, providing there is plenty of room for tying them down to the trellis. It will be necessary to guard against over-cropping, as quality is always of more importance than quantity, and this can only be attained by erring on the safe side in the removal of surplus bunches. If on solid stands, with a sharp heat below and fermenting material placed loosely round the pots, liberal supplies of stimulating liquid may be more frequently given than when they are tightly plunged up to the rims. Top-dress with rich soil and rotten manure confined within temporary rims of zinc or lead 4 inches deep, placed on the tops of the pots as a means of insuring the downward passage of the water through the balls. In all cases where the pots are to remain undisturbed until the Grapes are ripe, the roots may be allowed to follow the liquid through the hollow brick pedestals, or into the plunging material, when the fruit will be fine in proportion to the number of feeders which have gained their liberty. Give close attention to stopping, tying and thinning in the early house, and observe great firmness and determination in the removal of superfluous bunches before they have time to rob the Vine, bearing in mind that a reasonable reduction in the number of bunches does not always represent a corresponding reduction in weight when the Grapes are ripe. Many good Grape growers have regretted when too late having left too many bunches on their Vines, but I never heard one say he was sorry for having given them the benefit of a doubt. The earliest Muscats, now approaching the flowering stage, assuming that they have an efficiently heated house to themselves, will require a night temperature of 65° to 70°, with a corresponding rise of 10° to 15° by day, and in the event of a return to bright weather the house may be closed at 80° to 85°. When they come into flower it will be necessary to fertilise every bunch with great care, either with their own or Hamburgh pollen: I always give preference to the latter, as two birds are killed by one stone—first in the collection, which improves the Hamburghs, and afterwards in its application to the Muscats, which invariably set well. In the successful management of these early Muscats something more than impregnation is wanted: the wood should be thoroughly ripe and the roots should have the benefit of a well drained warm internal border, which has been well mulched and fed through the past growing season, for the twofold purpose of forming and keeping an abundance of healthy roots at home, instead of driving them downward or outward in search of these important elements. Assuming that late Grapes were removed from the Vines early in January, houses containing Lady Downe's and other winter kinds should be closed by the end of the month and well watered with water at a temperature of 90°. The rods will require copious syringing two or three times a day, and if sufficient fire-heat, aided by the use of fermenting material, be applied to the maintenance of 55° at night to 65° by day, a gradual advance will be secured, with every chance of the Grapes becoming ripe and fit for keeping up to the end of May, 1881. In fine seasons late Vines will break and ripen their fruit under the influence of solar heat, but in cold situations the past year has taught the wisdom and economy of giving a little help in the spring instead of having to drive the fires in the autumn, when the Vines should be going to rest. *W. Coleman, Eastnor.*

### ORCHARD-HOUSE.

Those of us who live within the limits of the London fogs have had enough to do this winter season. If the glass had been kept anything like clean, it ought to have been washed after every thick fog, and it was necessary to do this where plants were subjected to a growing temperature. The cool orchard-house was not touched until now, so that the glass was covered with the successive fog deposits of the last three months, and it was quite as opaque as if it had been smoked over a burning tallow candle. It has now been thoroughly washed, and as the blossom-buds are swelling it will not do to allow any more deposit to remain on the glass. If the trees have not been looked over, it will now be necessary to do so; the brown scale may not be noticed by the inexperienced, but if left on it is a troublesome parasite, and increases rapidly with increasing warmth. It may now be found in the form of reddish-brown cases attached to the smaller branches of the trees like limpets to the rocks: these are full of rudimentary scales; they should be removed with the finger-nails, and be carefully conveyed out of the house—the wood where they were attached to be washed clean with soapy water. The Peach aphid will be found on the young wood amongst the expanding flower-buds, clinging to and sadly crippling them. It is quite right to wash them off with soapy water, but I

never trust altogether to this and generally fumigate the house until the aphides are destroyed. While looking over the trees it may be well to thin out the branches where they are too crowded. Strong vigorous shoots that are sparely or not at all furnished with flower-buds should be cut back, or perhaps cut out altogether.

Pear and Plum trees also require attention in this respect: these, owing to summer pinching for many seasons, are frequently over-crowded with spurs and blossom-buds; under such circumstances a judicious use of the knife becomes a necessity. Strawberry plants on the shelves near the glass are looking very well, and those that have been taken out of the house and placed in forcing-houses show blossoms very freely. Last year was one of the worst known to me for ripening the crowns of Strawberry plants, and I attribute the good show of blossoms to the method of treating the plants during the summer and autumn. As soon as the plants are well rooted into the large 60-sized pots into which they are layered they are repotted into 6-inch pots, and each pot is placed on a brick that has been laid quite level on the ground. The position selected is one well exposed to the sun, and last season ours were, in addition to this, sheltered by a brick wall from the north and east. See that none of the plants suffer for want of water at the roots, but water them before the soil in the pots is anything like quite dry.

In the forcing orchard-house, where the trees are in flower or well advanced towards it, supposing the roots have been proportionately active, a minimum temperature of 55° ought to be maintained. The trees ought also to be further stimulated with tepid water. If there is no other convenience it is a good plan to place several potsful over the hot-water pipes. At this season the trees ought to be syringed on the mornings of fine days. Syringing must be discontinued when the trees are in flower—at that critical period the temperature ought to be kept up to not less than 55° at night with an increase by day; the top and bottom ventilators must be opened to cause a circulation of air by day, but not so much as to lower the temperature too much. See p. 143 for further information. *J. Douglas, Loxford.*

ORANGE-HOUSE.

As the season advances it will be easier to keep up the temperature; even in our house, efficiently heated to grow Pines, the pipes have been often much warmer than we cared to have them. There are occasionally days of sunshine, and it is wise to shut up the house about 2 P.M., and thus retain the heat, which is more congenial than that from hot-water pipes. The temperature may now be advanced from 55° or 60° to 65° at night, and by shutting up with sun heat, even this may be increased to 70° for a considerable portion of the night. The cultural directions given at p. 143 still apply. *J. Douglas, Loxford.*

PLANT HOUSES.

ORCHIDS.—The blinds or shadings used on the houses containing these plants should be at once fixed in their places, ready for use at any moment. It may happen that for days after there will be no need to use them, but the chances are after the middle of February that we shall speedily find the sun getting too powerful for some Orchids, especially if it shines forth in the middle hours of the day. In the cool-house, the temperature under the sun's influence will be rising above what is found necessary to grow the inmates to the highest point of perfection. This will certainly be the case on clear, bright, cold days, when the external air being perhaps several degrees below 40° is unsuitable to be admitted with sufficient freedom to keep down the temperature. At such times use the blinds. With the external air congenial, that is above 45° and moist, give abundance of air and shade less. The blinds on the Cattleya, intermediate and East Indian-houses, will only have to be let down for an hour or so over those roofs which fully face the sun. No system of shading these houses has ever answered so satisfactorily as the old one of canvas and roller blinds. Fixed shadings of any sort must have been all through last summer a mockery to the plants, seeing that there was nothing to shade them from. The blinds for the first three named houses should when down be 4 or 5 inches above the glass. This is best done by fixing strips of wood to run the rollers on above the roof from top to bottom. By this plan abundance of light and air passes up between the canvas and glass, the benefit of which, as regards the growing of Orchids, cannot be over-estimated. The canvas on the East Indian-house may touch the glass, as a maximum of sunheat without scorching is the thing required in this division. The Mexican-house should either have a thin blind or be lightly stippled so soon as the sun gets really strong; it will take no harm for the present. Besides the ordinary shading, the glass near to the shade-loving Bolleas, Pescatoreas, Batemannias, and Hunteleys, should be painted over with "summer cloud." For two seasons we have for this purpose used the green kind, and the

plants have grown fast and well. It is now time to take the whole of these from their winter quarters in the East India-house to a quiet position in the intermediate house. By quiet I mean the very opposite to an airy exposed position. Give these plants frequent waterings at the roots, and keep the atmosphere well charged with moisture. The imported pieces of *Bollea caelestis*, *Pescatorea Klaboehiana* and *P. cerina* received last autumn will now be making both shoots and roots, and will require a thin layer of peat and sphagnum for the latter to run in. The present is an excellent time to break up old plants or to give more root-room to *Odontoglossum vexillarium*, *O. Roezlii*, *O. Warscewiczii*, *O. naevium majus*, *O. blandum*, *Masdevallia tovarense*, *M. bella*, *M. Chimera Wallisii*, *M. Bakhousiana*, and *M. nycterina*. The four last-named should in every case be grown in baskets, and as their flowers are produced Stanhopea-like, from descending stems, no crocks must be used; a moderate quantity of peat and sphagnum not too compressed will grow them to perfection. For the other plants mentioned the pots should be two-thirds full of drainage, and the compost should consist of two-thirds sphagnum to one of fibry peat. In potting throw in here and there a handful of small broken crocks and charcoal, which will greatly assist towards keeping the whole mass sweet. With the exception of *O. Roezlii* the whole of these plants will in a few weeks' time have to be moved into the cool-house; between now and then they will have time to establish themselves if potted at once. *O. Roezlii* should be grown with its foliage almost touching the roof glass at the coolest end of the East Indian-house. It will take more water but less root-room than *O. vexillarium*. An interesting Orchid now flowering is *Epidendrum Parkinsonianum*, a plant with very small bulbs, but with such large fleshy leaves that at a short distance it might easily be taken for one of the smaller growing Aloes. Owing to the weight of the leaves the plant grows in a downward direction, hanging, in fact, by its roots. The flowers, which are produced from the base of the leaf, are in size and colour much like those of *Brassavola glauca*, the lip is a good white, and in shape resembles a butterfly. Like *E. ciliare* and *Angraecum sesquipedale* this plant emits a powerful perfume during the night. Give it block treatment, and grow it in an exposed position in the Mexican-house with very little water at any time. The change in the weather is a very beneficial one for Orchids, and I hope it will last long enough to give us all a "breather." Gradually increase the ventilation in every department when the air is calm and mild; at the same time bear in mind that plants after twelve weeks' almost close confinement do not appreciate large volumes of fresh air. Their breathing organs are indeed almost as sensitive to changes of atmosphere as those of a human being just recovered from an attack of bronchitis. The following night temperatures must be maintained:—Cool-house, 50°; *Cattleya* and intermediate-house, 58°; *Dendrobium*-house, 62°; East Indian-house, 65°. *J. C. Spyers, Burford Lodge, Dorking.*

TOWN GARDENING.

The long continuance of cold weather we have experienced has very much retarded all outdoor gardening; and now that the weather has broken we shall have to be extra brisk in pushing forward all alterations of shrubberies, lawns, walks, &c., that are intended to be done. Walks and lawns should be well rolled after the frost. The time has now arrived when the arrangements for the summer bedding dis-

play should be made. The first question that arises is, "What design shall I have on this bed, and how shall I arrange that border?" Now I think the arrangement greatly depends upon the taste of the employer whom you have to please. To suit the general public, so far as my experience goes, there is nothing like a bed, or border, arranged with the brightest of colours. For instance, a bed planted with *Alternanthera amœna* and Golden Feather, or a border planted with the brightest scarlet *Pelargonium* and yellow *Calceolaria*, would suit them far better than all the mosaic or artistic table beds that could be arranged of succulents and foliage plants. For my own part I would rather see it a little more quiet, and I presume that the gardening fraternity will generally agree with me. Whether you are going to have a carpet, mosaic, or artistic table bed or otherwise, a plan should be made out in the first place, in pencil, so as to give an idea of the manner in which it is intended to be carried out, and a calculation made of the quantities required for each respective bed or border, so as to give time to make up the required quantities which are found deficient. Previous to planting, the final plan should be made, inked, and if lightly coloured, showing the colour of the plants in each row, panel, or ring, this will greatly facilitate the work of planting when that commences. There is nothing that tends to forward the work more than to know what you are going to do when you begin, and there is nothing that retards it more than to have to take up a row, panel, or ring of plants for want of not knowing beforehand whether you have sufficient to carry out the work. When once a bed is arranged so it ought to remain, for if you have to make alterations in it when once the planting is commenced, you often have to arrange the whole bed afresh; and this can only be avoided by deciding on the arrangement previously. In fact, to tread on any flower bed or border too much makes the soil heavy, and the plants never do so well in it. In preparing the ground for a carpet, mosaic or artistic table bed, the first thing to be done is to make up the edging, which I consider is half the battle; it may seem to a non-practical person a very easy task, and so it is to those who know how to do it, but you find very few men that can do it well—they either set it up too hard or not hard enough; if it is set up too hard many of the plants will not grow in it, and if it is not set up hard enough, it crumbles by the drought before the summer is over, or it gets washed down with wet. If two rows of *Echeveria secundanglaucæ* are to be planted on the slope, which will take a 6-inch slope, the soil in the first place should be laid close up to the grass, in a rough form, and trodden down moderately firm, then with the back of the spade pressed firmly back in a sloping position (the angle of 45° perhaps is best), cutting off the soil on the top of the slope down to the required level. In making up the interior slopes or cornices of beds the same rule holds good. The groundwork is the grand object; that, well done, is half the battle. I have mentioned the *Echeveria*, for this is the best plant I know for forming the edging and groundwork of the above-mentioned beds. I might have added, the plants should be planted triangular-fashion, not opposite. Carpet beds should be levelled from edging to edging, and when once level they should not be trodden upon. I find the best plan is to have a 15 or 20 feet 3-inch plank (as required), set on a large flower-pot on either side of the bed, or on wooden trestles on three legs, for the planter to stand or kneel upon while inserting the plants. Levels should be put in and sections cut on the ground previous to the formation of the bed. *William Gibson, Royal Hospital Gardens, Chelsea, S.W.*

SUMMARY OF METEOROLOGICAL OBSERVATIONS IN 1879.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb. 16	{ Sale of Imported Orchids, at Stevens' Rooms (New Plant and Bulb Co.).
TUESDAY,	Feb. 17	{ Sale of the Stock at the Hill Side Nursery, Exminster, by Protheroe & Morris (two days).
WEDNESDAY,	Feb. 18	{ Sale of Imported Orchids, at Stevens' Rooms (Messrs. H. Low & Co.).
THURSDAY,	Feb. 19	{ Meeting of the Linnean Society, at 8 P.M. Sale of Imported Orchids, at Stevens' Rooms (Mr. F. Sauder).
SATURDAY,	Feb. 21	{ Sale of Roses, Fruit Trees, Shrubs, Bulbs, &c., at Stevens' Rooms.

THE annual meeting of the ROYAL HORTICULTURAL SOCIETY, which was held on Tuesday last, presented a great contrast to that of some former years, and not wholly for the better. It was not lively. It was gloomy. Fog settled down over the region of South Kensington about the time the meeting began. Yellow flickering gas essayed to cast a brilliancy on the scene, but it hissed at its own mockery. The dismal surroundings took effect alike upon Council Fellows. Their depressing effects were heightened by the nature of the report, which was "taken as read," having been circulated some time previously—a procedure for which, by the way, the Fellows should be grateful. The prevailing objective gloom and the innate subjective depression told on the eloquence of the President. He halted as he spoke of the Chancery suit—he bemoaned the state of the balance-sheet—he recommended economy as he might have urged a Lenten discipline—he told the Fellows that they were no longer justified in running risks—he told them, what was substantially true, that last year the stars in their courses had fought against the Society—that the Council had sown, but that they had not reaped—that the Chancery suit was entered into in defence of the rights of the debenture-holders, and that there was a reasonable chance of its being decided in the course of this month. Whatever might be the result he did not think that the connection between Her Majesty's Commissioners and the Society would be necessarily severed.

Such is the gist of the President's remarks, omitting more detailed allusion to the financial state of the Society and the balance-sheet. The latter document was as edifying as the balance-sheets of public bodies usually are. A special course of training should be entered upon by all those who wish to understand balance-sheets, but it must be stated in fairness that it was circulated some days before the meeting—a practice we heartily commend.

Mr. GUEDALLA, who rose to propose a vote of thanks to the President, Council, and officers, endeavoured, as he said, to pour oil on the subject—though why he wanted to do so was, under the circumstances, not very apparent—there were no angry waves to be smoothed over, no turbulent manifestations to receive a *quietus*. Substantially, he commended the Council for their action, and stated that if the suit were abandoned on the part of the Commissioners, the debenture-holders, of whom he was one, would be disposed to meet the Commissioners upon more equitable terms than those previously proposed. Mr. GUEDALLA regretted the falling through of the proposal to hold an International Exhibition this year, as advocated by a "most excellent horticulturist;" suggested that each of the neighbouring houses should be taxed to the extent of £20 a year for the support of the Gardens, and ended with a reference to peace and honour—which was very infelicitous considering the condition of the Society.

Mr. KELLOCK called attention to the mislead-

ing item in the accounts relating to the life compositions. All those who know the history of the Society know that the composition fund was most improperly spent some years ago. If, as we are annually assured, the inclusion of this item is a necessary formality of no real significance, it would be better to put an explanatory foot-note to the balance-sheet, and so avoid the appearance even of misleading.

Mr. LIGGINS desired to strengthen the hands of the Council by proposing a special vote of thanks to them for their "noble conduct" in maintaining the rights of the debenture-holders, and this was carried.

Such, in brief, and with the omission of certain matters of detail, was the general impression conveyed by the meeting. The President, though, as we have said, clearly depressed by the fog or by the nature of the work he had to do, still showed much of his adroitness in gliding skilfully over thin ice, and in maintaining reserve upon points that might arouse contention. To give one instance, not a word was said in the report nor in the speech from the chair as to the Preston *fiasco*.

So far then, we have alluded simply to the cloudy side of affairs, and in so doing we have only followed the course sketched out by the President. But it would be very unfair not to admit that there is another view of the matter, and a much brighter one. The President was, we think, ill-coached, or at any rate ill supported, by those who know what useful horticultural work the Society has done and is still doing in the face of much depression and discouragement. The work of the Committees is on the whole well done, and is most serviceable to horticulture. The evil times which have fallen on the Society seem to have no direct effect at any rate on the varied utility of these meetings. On the very day of the annual meeting a paper was read by Mr. GEORGE MAW on the structure and geographical distribution of various species of Crocus, elsewhere alluded to, illustrated by specimens and a whole series of admirable drawings. We allude to the paper in this connection, because it was one which would have conferred honour on any learned society in the kingdom, as the Fellows will be able to judge for themselves when the paper comes to be published in the *Journal* of the Society. The work at Chiswick, too, hampered as it is by adverse circumstances, is very creditable to all concerned, and even on financial grounds may be commended as a "paying" concern, whatever we may think as to the appropriateness of a learned Society selling market produce.

Those who look gloomily on the Society's prospects should avert their gaze from what we may call local politics, which are but vanity and vexation, and direct it to the real horticultural work of the Society. They would then find that the old spirit was still alive and at work, and not the blighting influence of South Kensington, nor the terrors of a Chancery suit, nor an impoverished exchequer will be able to quench it.

The Council deserve well of the Society, and if they, perhaps not unnaturally, seemed dull and depressed when they met their constituents the other day, they may seek relief in the knowledge that they have the sympathy of the horticulturists, and in the cheering prospect that considering all the adverse circumstances the horticultural work of the Society is still efficiently carried on. The more work done in this direction the sooner will the Society emerge from its depressed state, the more it will rise in the estimation of the public.

— SEED POTATOS FOR IRELAND.—In the House of Commons on Tuesday last Major NOLAN, M.P. for Co. Galway, moved the second reading of his "Seed Potatos (Ireland) Bill," which has for its object the authorisation of the guardians of any union in Ireland, with the consent of the Poor Law Commissioners, to borrow money from the Commissioners

of Public Works with a view to purchasing seed Potatos and supplying the same to distressed tenants. If the Bill was passed these advances would be charged upon the poor-rates, and the entire amount advanced to any union would not be allowed to exceed one-fourth of the sum at which all lands within the union are rated. No interest would be paid by the guardians, but the principal would be repaid within a year of the advance. The seed Potatos purchased with these moneys the guardians would sell to tenants of land within the union, who would undertake to plant them; but no one occupier would be able to buy more than £5 worth. These sales would be made at cost price or under, either on credit or not, and either with or without security, as the guardians might think fit. The price of the seed Potatos would be recoverable by the guardians at petty sessions. Finally, the Treasury would be empowered to issue out of the growing produce of the Consolidated Fund half a million, if required, for the purposes of the measure. The period named for the operation of the Bill is "a year after the passing thereof and thence to the end of the next session of Parliament." The CHANCELLOR of the EXCHEQUER said that the object of the Bill was one which the Government to a certain extent entirely approved. They approved the method which the hon. and gallant gentleman proposed to adopt, but the Bill in many particulars required amendment. In the first place they did not think the Bill ought to be confined to Potatos. The Government also thought that the time which the hon. and gallant gentleman proposed for repayment was rather short. There were other points, too, as to which in quiet consultation an agreement might be come to that amendments would be desirable. Therefore the course he proposed was, that they should agree to the second reading on the understanding that the hon. and gallant gentleman would take the committee *pro forma*, and then that the Bill should be carefully considered before going regularly through committee. The Bill was then read a second time.

— GENERAL MUNRO'S BEQUESTS.—We understand that the late General MUNRO has bequeathed to the Kew Herbarium his collection of grasses, his manuscripts, and such of his books as are wanting in the library.

— THE VINE LOUSE AT THE CAPE.—The Cape Vine-growers are, it appears, under the influence of fright as regards the invasion of the Phylloxera. We by no means regard their apprehensions as unjustifiable, but we think they require to keep their heads cool and not to give way to panic. In the first place Mr. ROLAND TRIMEN, a competent entomologist, has reported that there was no Phylloxera on the living specimen submitted to him on the spot; the specimens sent to England have also been pronounced free from the pest. So far so good—there is no evidence of the existence of the pest in South Africa yet. Naturally the colonists are very desirous to keep it out, and the authorities have, if we are not misinformed, proposed to their Government to enact a law prohibiting the importation of all plants whatsoever. We have not seen the official statement, but merely a telegraphic report. Assuming it to be correct, we must say that such an enactment would be stupid and futile. No such law, however vigorously carried out, would suffice to prevent the entry of the insect. It may indeed be wise and judicious to exclude Vines. To import them from infected countries would be to court the evil they seek to avoid, but to extend the interdiction to any other plants than Vines would be worse than ridiculous, it would be suicidal. It is ridiculous because the plan cannot be effectual—the Phylloxera is not likely to be introduced except on or about Vines (thought it might be so), but if so it would pay no heed to such obstacles to its progress; it is suicidal, because such a law would fetter commerce and prevent the introduction of other plants likely to be of commercial or economic importance. Careful supervision, with the assistance of a competent entomologist, and the power to destroy immediately all the Vines within a given area when proved to be infected, are the means most likely to be effectual in checking the progress of the insect. Because one industry is threatened, surely it is not wise to throw obstacles in the way of others, which might compensate for the losses occasioned by the failure of the wine crop.

— PLANTS OF THE KURRUM VALLEY.—There is, it seems, a hope that our "scientific frontier" may, after all, be productive of some scientific benefit. Among the many beautiful specimens brought from Afghanistan by Dr. AITCHESON are a fine new Clematis with large primrose-yellow flowers, and a yellow Rose. It may be hoped that these, with other treasures, will be secured to our gardens. Dr. AITCHESON, we believe, is about to return to the front, but proposes at an early meeting of the Linnean Society to give some account of the botany of the region in question.

— DAPHNE COLLINA is a fine old-fashioned shrub, not often seen now. Its oblong-lanceolate leaves are a deep shining green above, white and

(1.) *Pollice*, fruit indehiscent; (2.) *Commelyneæ*, capsule loculicidal, fertile stamens 3-2; (3.) *Tradescantieæ*, capsule loculicidal, fertile stamens 6-5. He drew attention, moreover, to the manifest and important change of colour in the petals of several of the species, *Ancilema versicolor* to wit, where from a bright yellow when fresh they become of a deep blue when dry.

— CONTINENTAL VEGETABLES.—Those who may be desirous of testing the merits of such vegetables as are served at Continental *tables d'hôte* with the sorts grown in England have now an excellent opportunity for doing so by obtaining Messrs. JAMES CARTER & Co.'s newly introduced "Continental Collection of Vegetable Seeds." The collection in-

valuable a refuse, is one which might be adopted with advantage in this country." Can Mr. FORTUNE enlighten us?

— THE SEVERE FROSTS IN FRANCE.—The *Société Centrale d'Horticulture de France* has appointed a commission to ascertain the effects of the frost in December, 1879, and to report thereon.

— ACACIA HOMALOPHYLLA.—A series of the pods of this plant was shown by Mr. R. IRWIN LYNCH at the meeting of the Linnean Society on February 5, wherein each seed was attached by a very long and bright red funicle, which is doubly folded on the sides of the seed. Mr. LYNCH offers the supposition that the funicle, always detached with the

FIG. 38.—FRUITS OF THE MALAY PENINSULA. (SEE P. 203.)

downy beneath. The pinkish flowers are in tufts at the ends of the branches, and are very fragrant. It is quite hardy, as witness some specimens recently sent us by Mr. BOSCAWEN in bloom, in spite of the severe weather to which even in Cornwall it has been exposed.

— THE COMMELYNACEÆ.—At the Linnean Society, April 5, Mr. C. B. CLARKE gave an oral exposition of the Commelynaceæ, which order he had lately worked out for a forthcoming volume of DE CANDOLLE'S Monographs. He defined the order by the position of the embryo. An important auxiliary character is that the three segments of the calyx are always imbricated, so that one is entirely outside the two others. Mr. CLARKE divides the Commelynaceæ into three tribes, as follows:—

cludes eighteen well selected varieties of Dutch, German, and French nationality. Aubergines and Virtuous Cabbages should be no novelties after this season.

— A HEAVY KOHL-RABI.—At a recent meeting of the Berlin Horticultural Society a fresh specimen of Kohl-rabi was exhibited, which weighed nearly 8 lb. English.

— BEAN-CAKE MANURE IN CHINA.—"H. K." writes:—"I distinctly remember boarding junks laden with cakes of artificial manure upon the coast of China, but had supposed that it was of another description to the Bean-cake, the refuse of the Bean-curd, which is so commonly sold in China. If so, the manufacture of a palatable food, which leaves so

seed, from its brilliant colour, serves as an attraction to birds, and in this way assists in the dissemination of the plant.

— FRUIT PROSPECTS.—A survey of the hardy fruit trees is not productive of a reassuring effect. We may have a most genial spring and a glorious summer, and out of such blessings we may well hope to gather in abundance the fruits of the earth, but how if the "fruits," not metaphorically, but literally, are few and far between? All hardy fruits, but specially all hardy tree fruits, are contingent for their proper production upon two favourable seasons—one to ripen the season's wood and swell the bloom-buds, the other to set the fruit and bring it to maturity. But of these two seasons perhaps the first is the most important, because unless its functions are well per-

formed those of the other will be but in small request. The fruit trees may have all the wood, not of the last but of the preceding year ripe and matured; that is the case without doubt, but the spurs or bloom-buds, even though fairly abundant, lack substance and plumpness; they do not indicate strength and maturity, and out of such comparative incompleteness we wonder whence is to come health and vigorous bloom. There are never wanting excuses for an unfruitful season, when that common event takes place—it is either immature wood or spring frosts, or, as last spring, excessive rains washing out the pollen; and all are plausible, and sometimes exact. Next season, unless an immense change is evoked in the course of the spring, we shall have to record the imperfect state of the fruit-buds caused by lack of sunshine. All these things indicate the enormous risks incidental to fruit culture in this country, and show that it is not lack of trees, as is so commonly imagined by ignorant people, but rather lack of crops on the trees we have, that is the cause of the scarcity of fruits for the million, so often complained of. Unfortunately a sunless summer does not confine its mischief to that season only, but extends its disastrous effects over several successive ones.

— THE POTATO FAMINE IN IRELAND.—In the House of Commons on Tuesday last, on the motion of Major NOLAN, a select committee was ordered to be appointed to inquire into the best means of diminishing the frequency and extent of failures in the Potato crop.

— OUR JANUARY WEATHER.—The year 1880 began with a cold and foggy month, but it will bear comparison with recent precedents. The presence and duration of bright sunshine were recorded as follows at the Royal Observatory, Greenwich, by CAMPBELL'S registering sundial, in January, 1878, 1879, and 1880:—

	1878.	1879.	1880.
Days with sunshine..	17	8	14
Hours of sunshine ..	35.0	14.8	42.3

On January 30, 1880, the sun shone brightly for 7.6 hours, a period of sunshine not approached on any day in January, 1878 or 1879. The above record is of "bright sunshine," and it may be well to bear in mind that when fogs are about the sun may at times be visible, and yet not have sufficient power to make any impression on the sun recorder. The lowest night temperature recorded at Greenwich Observatory in January in the three years was as follows:—25°.7 in January, 1878; 19°.4 in January, 1879; and 17°.2 in January, 1880, this last occurring on January 27; but in none of the three years did the greatest cold of the season occur in January. The mean daily temperature of the air was below freezing point on only one day in January, 1878; on nineteen days in January, 1879; and on thirteen days in January, 1880. The rainfall was only 0.87 inch in January, 1878, but was 2.60 inches in January, 1879, and only 0.27 inch in January, 1880. All the above results are obtained from observations at Greenwich, but, this being a suburb of London and within the registration division denominated "London," the Registrar-General has done well in giving the means of comparing the return with a weekly one for Glynde Place, near Lewes. In the five weeks ending January 31, 1880, there were 44.7 hours of bright sunshine at Greenwich Observatory, and 60.8 hours at Glynde Place—that is to say, about three hours at Greenwich to four hours in Sussex. *Times*.

— PAISLEY HORTICULTURAL SOCIETY.—This Society will hold a spring exhibition on Friday, March 26, and an autumn show on September 10.

— BRITISH BEE-KEEPERS' ASSOCIATION.—The annual general meeting of the members of this Association will be held in the Board-room of the National Chamber of Trade, 446, Strand, London, on Wednesday next, at 4 o'clock P.M., under the presidency of the Baroness BURDETT COULTS, the President of the Association.

— THE HORTICULTURAL SOCIETY OF FRANCE.—The officers elected to serve during the present year on the Council of the Horticultural Society of France are:—President, M. Alphonse Lavallée; First Vice-President, M. Hardy; Vice-Presidents, MM. Baillon, Burelle, Teston, Arnould-Baltard; Secretary, M. Duvivier; Assistant-Secretary, M. B. Verlot; Treasurer, M.

Moras; Assistant-Treasurer, M. Lecoq-Dumesnil; Librarian, M. Wauthier; Assistant-Librarian, M. Courcier; Secretary-Editor, P. Duchartre; Secretaries, MM. Leperé, Chagneraud, Lavielle, Curé. We are glad to see that M. LAVALLÉE has been elected to the office of President, for, besides being an eminent amateur and writer, he has taken great interest in the horticultural affairs of the Society, differing in that respect from his predecessor, the Duc DECAZES, who, while in office, was never seen at any of the meetings of the Society or at its shows. M. HARDY, the First Vice-President, is the well-known Director of the School of Horticulture at Versailles, and was at the head of the horticultural department in the International Exhibition of Paris in 1878.

— THE YORK GALA.—The committee have this year made some alterations in their schedule, which now includes "groups of plants arranged for effect," each competitor being confined to a space not exceeding 200 square feet. These competitions are undoubtedly in the right direction, as they are educational in their character, and there is much room for improvement in this way. It is no uncommon occurrence to see ability to grow plants fairly well where there is little taste evinced in their grouping, or in the disposal of them to the best advantage. Plants at the present day are so much in demand on festive occasions for grouping in halls and similar places, that it is part of the gardener's duty to be able to do this in an artistic and effective manner, very different from the massing and crowding together, frequently met with, of a number of fine-leaved and flowering specimens, many of them perhaps unsuitable for the purpose employed. In many of the provincial shows where prizes have been offered for groups of this kind, the mistake is frequently apparent of the competitors over-doing their arrangement by using too great a number of large specimens, evidently under the impression that these will carry weight individually, but in all competitions of this description it should be borne in mind that it is the collective taste displayed in the whole assemblage that must bear the palm. A light, elegant habit of growth in the larger plants employed is generally most effective. There are as well the usual classes for flowering stove and greenhouse plants—fine-leaved subjects, Ferns, pot Roses, and the numerous divisions of Pelargoniums which are seen here in such force as nowhere else in the kingdom at the present day. A liberal amount is offered for cut Roses; also for fruit, in which there are three classes of collections, consisting of four, six, and ten varieties, the prizes for the latter being £10, £7, and £5. Altogether the schedule, comprising over eighty classes, offers plenty of room for exhibitors, and we have no doubt it will, as hitherto, bring out a spirited competition.

— FRUIT FORCING AT FERRIÈRES.—The first ripe Strawberries of the season were gathered at Ferrières on January 22. They were of the Marguerite variety, of large size, but rather pale, and not over-sweet.

— BASKET ACHIMENES AT CHATSWORTH.—Those who have visited Chatsworth at the end of the summer must have admired—as who can help admiring?—the very fine hanging baskets of Achimenes seen in the Victoria regia house and the large tropical conservatory. When at their best these baskets are from 5 to 6 feet in depth and width, and they represent huge balls of blossom, the profusion of which is represented by hundreds. The flowers are of great size and richly coloured. The baskets are formed of wire, and are of globular shape; the centre is filled with moss, and between the moss and wires there is a thick layer of rich soil. The corms are started into growth in heat, and then planted all over the globes, so that the small plants point their shoots in every case outward, and as they grow form a dense mass of foliage, which in due course puts forth numberless flowers. What hanging baskets they make! They are of such stupendous size that, if seen at a large exhibition, they would be looked upon as floricultural wonders; but how to get them there is a matter of much difficulty. What can be so well done on a large, can also be managed on a small scale; and gardeners not in the habit of using Achimenes in this way as decorative plants can now be made aware

what fine subjects they are for this purpose. A good stock of plants is necessary, but there is little difficulty in securing this in two or three years. The most suitable varieties are Baumanni hirsuta, Carl Wolfarth, Ambroise Verschaffelt, longiflora, longiflora major, Margaretté, Dazzle, Mauve Queen, Mauve Perfection, and Harry Williams.

— SONERILA MARGARITACEA.—It is something like thirty years since this pretty and interesting plant was introduced by Messrs. VEITCH & SONS, and it is to be feared it has now fallen so far away from general cultivation as to have a place among neglected plants. There are, however, some gardeners who do not relinquish their appreciation of its beauty and usefulness, and it is occasionally met with as large specimens, well grown and charmingly flowered; a thing of beauty for many days in a stove-house. It is a variegated-leaved, dwarf-branching, sub-shrubby perennial, with foliage of a peculiarly pleasing character, which was once not inappropriately described as looking as if sown with pearls. Then the flowers are very pretty, and produced in bunches; they are of a gay rose colour, enlivened in a remarkable manner by the large prominent yellow anthers. There are its varieties alba and superba; and in addition S. Hendersoni, and Hendersoni argentea. Well managed plants will grow into a large size—some have been met with fully 2 feet in diameter.

— HOW A BOTANIC GARDEN IS FORMED IN JAPAN.—The following extract from a report from HAKODATE, in Southern Vesso, will indicate the aptness of those intelligent people, the Japanese, to seize a new idea. "An inkling," it is stated, "was given to three of the principal native storekeepers by a lady resident to start a botanical garden. The idea was jumped at, as this was the very thing they had always desired to have, the Japanese being so very fond of flowers, and more especially foreign flowers; but the individuals in question, who are brothers, did not know how to set about it, and what seeds to order, and when they had them what to do with them. Accordingly a plan for a garden was drawn up, and some one having an idea of gardening was engaged, after which a spot of ground was selected most suitable for a flower garden, but when application was made for it the Kaitakushi took the matter in hand, and has now started a public garden, the foreign directress still being consulted on all matters. In order to give it the character of a public undertaking, every ward of the town was induced in succession to work there one whole day, besides the regular coolies paid by the Kaitakushi. When the whole town had thus contributed its quota of labour, all the singing girls of the tea-houses, with the other inmates of these establishments, dressed up in gay colours, were engaged there one whole day in smoothing down the paths with a stone fastened to ropes handled by about a dozen girls each, singing and dancing all the time; and, to crown all, one Sunday all the officials, from the highest to the lowest, dressed in labourers' working clothes, were engaged in finishing the "fusiyama," of the garden, without which no Japanese garden is complete."

— SCHIZEA PUSILLA AND LITTORELLA LAECUSTRIS IN NOVA SCOTIA.—On the authority of DR. ASA GRAY and Professor EATON, we learn from American serials that both of these plants have been recently discovered in Nova Scotia, by Miss ELIZABETH G. KNIGHT. The interesting and rare little Fern, *Schizaea pusilla*, was only known with absolute certainty to occur in the State of New Jersey, though Dr. GRAY says he has seen specimens of it in LA PYLAIE'S herbarium at Paris, collected sixty years ago, which are labelled as having been collected in Newfoundland. *Littorella* was discovered by a Mr. PRINGLE at the northern end of Lake Champlain only a short time before Miss KNIGHT found it in Nova Scotia, but it had not previously been found in America. Indeed until these discoveries *Littorella laeustris*, unlike most aquatic plants, had apparently a very restricted range of distribution, being confined to Central and Northern Europe.

— WINTER GREENS.—A gardener writing recently said, "The hard weather has left my garden for green crops almost a wilderness, what must the market gardens be like?" Well a survey of market gardens just now is not a pleasant one, neither does it give any evidence of prosperity. What breadths of

greens of any kind there may be found are now fast disappearing, whilst the hard frost has already made a clean sweep of all white Broccolis. Green stuff is selling just now fairly well, and thus it is being somewhat rapidly cleared off. Savoys, usually one of the most substantial of the winter Brassicas, are very small, and a large extent of ground is cleared to make a market-load. Brussels Sprouts have long since been cleared off, and these as a rule were small and soon stripped. The best of the family for all late general purposes is the hardy Purple Sprouting Broccoli, which where not strong, as that is a rare case; it has stood well and will presently give some good cuttings, but being the last of the standing winter crops will soon be finished up. When this is gone there will be a comparative dearth of green stuff, as the autumn-planted Cabbages are in poor condition, and will most probably run off to seed rather than turn-in with decent heads. The summer of the past year was so bad that it has produced great distress amongst market growers; such seasons produce losses that even those most concerned do not care to calculate. The hard winter has added to the general disaster by the damage it has wrought amongst the green crops, and now that the season for seed sowing has arrived the growers find with alarm that such things as Peas, of which some need very large quantities, are being offered to them at from 50 to 60 per cent. advance in price. These things show somewhat forcibly how many are the troubles and disasters incidental to trade gardening, and how far it is from being always a source of wealth and prosperity.

— THEN AND NOW.—The modern growth of catalogues is illustrated in a remarkable manner by a contrast of the new with the old. There is lying before us a copy of a seed catalogue issued by JAMES CARTER, seedsman and florist, 238, High Holborn, London, and represented to be a "Catalogue for 1842 of a Choice Collection of Floricultural, Vegetable, and Agricultural Seeds," a thin pamphlet of some thirty-two pages, of about the size of a page of the *Gardeners' Year-Book*—a plain, unpretentious book, as unlike the finely illustrated list published by that old firm this year, as the worst form of railway carriage of twenty years ago is to the splendid saloon cars now in use. The list of Peas of that day was about one-fourth in number of the varieties now catalogued. It was the time when there were but very few wrinkled Marrows, when Sangster's No. 1, Champion of England, Prizetaker, Ne Plus Ultra, British Queen, and others, were unknown. The leading early Peas were then Early Racchorse, Warwick, single-blossomed Frame, double-blossomed ditto, Nimble, and Charlton; the main crop varieties the dwarf and tall white and green Marrows, Woodford Green Marrow, Royal Victoria Marrow, Knight's Marrows in variety—the forerunners of our fine wrinkled varieties—the Prussian Blue and the Scimitar. We have made some progress since then, and would fain hope it has been a healthy one all along the line.

— ALPINE PLANT CULTURE.—At the meeting of the Manchester Botanical and Horticultural Society held on the 4th inst., Mr. BRUCE FINDLAY presiding, Mr. STANSFIELD, of Kersal Moor, read a short paper on the subject of alpine plant culture. He said that to the advantage of warmth which alpine plants enjoy in consequence of the greater length of their spring-day must be added that of longer and more protracted influence of light. Alpine plants, like those of northern latitudes, are true children of the sun, for where there is shade the plants are poor and suffer, whilst on sunny slopes and peaks Flora is at home. The higher one ascends a mountain, as a rule, the lower will be the stalk or stem and the larger the flowers. The intense light and the long spring in the alpine regions, and in all polar countries, shortens the course of metamorphosis of plants. Inside the reproductive sphere a livelier action leads to quicker forms of flowers and fruit, and gives to the flowers an increased size and deeper colour. A vote of thanks having been accorded to Mr. STANSFIELD for his paper, he stated in reply that he would, when an opportunity offered, again come forward and continue the subject, which was almost inexhaustible. Mr. FINDLAY said they had last week had under consideration Orchids, the plants of hot regions, and that evening a distinct and opposite tribe, the natives of cold climates. He thought this an advantageous

opportunity of uttering a word of caution against the narrow spirit which characterised some botanists and gardeners. One said, "I am for Orchids and Ferns;" another, "I am for Carnations and Auriculas, and make nought of Orchids;" a third despised great Palms and stove plants, and went in for alpine. But however Art may reduce the productions of Nature to isolated groups, and divide them into separate sections, they are not absolutely separable. However diverse the distant members may appear, they are all intimately connected and essential to each other, and form in their respective subordinations but integral parts of one majestic and harmonious whole.

— THE PRODUCTION OF CAMPHOR AND VEGETABLE WAX IN JAPAN.—In some notes from Japan on the products of Hioga and Osaka, we are told that the value of camphor has increased considerably of late. Though the production is very large, it could easily be very much increased were better appliances adopted in its preparation. The method in practice is of the rudest possible nature, and very wasteful. It is suggested that the Government might fairly take the question up, as large tracts of country are being denuded of valuable trees which yield a comparatively poor return. The export of vegetable wax, on the other hand, continues to diminish, being at the present time less than one-fourth of the quantity taken in 1876. Although the damage done to the trees during the civil war in the south may have contributed towards its scarcity, it must be remarked that the almost universal use of kerosine oil must have at the same time greatly checked the native consumption of wax. Unless the production can be increased so as to admit of the article being sold at lower prices, there is some reason to fear that the trade may become wholly extinct, as manufacturers in Europe are already abandoning its employment in favour of cheaper substitutes, and the consumption is rapidly falling off.

— NEW CHINESE PRIMULAS.—We have been favoured with the opportunity of examining some interesting new Chinese Primroses from Messrs. STUART & CO., of Nice. They show considerable variation, and include some desirable novelties. One is a blush-white, freckled and occasionally striped with crimson, and with a bright yellow eye occupying half the diameter of the flower: this is very striking. Then there are two forms with the usual yellowish-green eye, exterior to which is a broad ring, occupying half the diameter of the flower, of a bright bronzy hue, the margin being in one case bright crimson, and in the other rosy-crimson. Neither of these three are very perfect as to outline and smoothness of surface, but they are large and bold flowers, and the other desired qualities will no doubt in due time be forthcoming. There is also a large, well-formed, smooth, deep rosy-lilac variety, in which the exterior margins show a white line. Two semi-doubles, a carmine-rose and a majenta-rose, are interesting, but these semi-doubles do not seem to be held in much favour by growers. Besides these are good strains of the ordinary colours, white, carmine, majenta, and blush-striped. They present altogether a very interesting selection.

— THE MANUFACTURE OF BRICK TEA IN CHINA.—In a recent report on the trade of Kiu Kiang some interesting facts are given on the manufacture of and traffic in brick-tea. Regarding the quantity of this kind of tea exported from Kiu Kiang the total amount in one year showed as much as 681,333 lb. There are three kinds of brick-tea made at the above-named place. The first or largest kind is a cake of coarse green tea which weighs when thoroughly dried about 3½ lb., and is about 1 foot long by 7 inches wide. These cakes are made in a wooden mould while wet, and compressed by means of a lever press, and afterwards dried. This is all done by hand labour, and affords employment to a large number of coolies. When dried each cake is wrapped in paper and packed in strong baskets; each basket of this coarse tea contains thirty-six cakes. The cost of this tea per basket is about £1 7s. sterling, and the annual exportation amounts to from 15,000 to 20,000 baskets. The tea is sent from Kiu Kiang to Tientsin, from whence it goes overland through Mongolia for consumption among the inhabitants of West and North-west Siberia, in the province of Kazan, on the Volga, and by the Kirgis and other Seutas tribes. A cake of tea of the same form, but

of a much commoner quality, costing about £1 1s. sterling, made by the Chinese at Yang-lon-tung, in Hupeh, is largely consumed in Mongolia. There being no copper currency in that country, the Chinese bankers in Mongolia keep stores of this brick-tea and issue it as a monetary medium. The second kind of brick-tea is of a finer quality, each cake weighing 1½ lb., and it is 8¼ inches long by 5¼ inches wide. It is packed in baskets, each containing eighty or ninety, and costs about £1 13s. per basket. This kind is consumed in West and South-west Siberia, at Kizan, and on the Amoor. The third kind of brick-tea is made of black tea dust; each cake weighs 2½ lb., and is 8½ inches long by 6 inches wide. It is packed in baskets containing sixty-four cakes each, and costs about £1 16s. per basket. It is consumed throughout Siberia and in Eastern European Russia by the pea-antry. It is made into cakes at Foochow, Kiu Kiang, and Hang-kow. The yearly exportation from the three places is about 100,000 baskets. It is stated that at Hang-kow there are now four brick-tea factories, two of which employ steam-power. The employment of steam instead of hand-presses will ultimately cheapen the cost of production, and at the same time a more satisfactory article will be placed on the market. Brick-tea made in the old manner was not pressed sufficiently hard to enable it to successfully resist the rough treatment it received *en route*, and frequently reached its destination in a broken and crumbling condition which detracted from its value, buyers laying considerable stress on the hardness and perfection of the brick.

— THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of this Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 18th inst., at 7 P.M., the following papers will be read:—"On Typhoons in China, 1877 and 1878;" by Lieutenant ALFRED CARPENTER, R.N., F.M.S. "Note on the Reports of Wind Force and Velocity during the Tay Bridge Storm, December 28, 1879;" by ROBERT H. SCOTT, F.R.S., F.M.S. "On the Frost of December, 1879, over the British Isles;" by WILLIAM MARRIOTT, F.M.S. "Thermometric Observations on Board the Cunard R.M.S.S. *Algeria*;" by Captain WILLIAM WATSON, F.M.S.

— INSTITUTION OF SURVEYORS.—The next meeting will be held on Monday evening, February 16, when the adjourned discussion on the paper by Mr. W. L. HUSKINSON, entitled, "The Present Depression in English Agriculture; its real and assumed causes," will be resumed. The chair to be taken at 8 o'clock.

— THE WEATHER.—General remarks on the weather during the week ending February 9, issued by the Meteorological Office, London:—"The weather during this period has been in an unsettled changeable condition. During the first three days it was dull and rather rainy in Ireland, fair over Scotland and the greater part of England, and dry but very foggy at our south-eastern stations. By the evening of the 6th, however, the unsettled weather noticed in the west had extended to all parts of our islands, and, with temporary clearances, continued till the close of the week. The temperature was about the mean for the time of year in "England, E. and S.," but a few degrees above in all other districts. The highest of the maximum readings, 57° at Leith and 58° at Dublin, occurred on the 4th. No very striking minima were registered, but sharp night frosts were experienced at many of our eastern and south-eastern stations until the 6th or 7th. The wind was generally south-westerly all over the country, but veering to north-west or north for a short time in Ireland on the 5th, and again on the 9th. In force it was moderate to fresh on most days, but blew a whole gale from the south on our west and north-west coasts on the 6th, and a very hard south-westerly gale in the Channel, and south and south-west of England, on the 9th. The rainfall was slightly more than the mean in all districts except "Ireland, N.," and the "Midland Counties," where the fall just equalled the mean.

— GARDENING APPOINTMENTS.—Mr. ROBERT STOTT, late Foreman to Lord ELPHINSTONE, Carberry Tower, Musselburgh, has been appointed gardener to Mrs. BAIRD, Stichel House, Kelso, Roxburghshire.—Mr. RICHARD MIDDLETON, plant foreman to Mr. GILBERT, at Burghley, has been engaged as head gardener to Col. WRIGHT, Watcomb Park, Torquay.

JAPANESE CONIFERS.—VII.

(Continued from p. 115.)

PICEA (Abies, Hort. Angl.) ALCOCKIANA.\*—Two, if not three, different Spruces are grown in nurseries under this name. The complications which have arisen with reference to it have already been alluded to when treating of *P. ajanensis*, p. 115. It is necessary for clearness sake to advert to them again, in order that our own standpoint may the better be understood.

The name *Alcockiana* was first applied in a letter from the late Mr. J. G. Veitch, published with a description in our columns in 1861, p. 23.

In that description the leaves are described as "planis obtusis," and again—"very small leaves, glaucous on the under side, blunt or emarginate not mucronate, and flat not 4-sided." The cone-scales are also described as obtusely rhomboid denticulate.

Murray, in his *Pines and Firs of Japan* cites the Latin diagnosis of Lindley and Veitch, and gives a full description in English with illustrative figures, drawn up apparently from specimens of Mr. Veitch. Without being able definitely to assert so much, we strongly suspect that, by some confusion, Murray described and figured the leaves of one species and the cone of another.

Carrière apparently arrived at the same conclusion that we have done, as his description coincides with our own observations. He does not say, however, that he has seen original specimens.

Next comes Gordon, who, though he does not say so, probably saw the type specimens, and he tells us (in his second edition) that the "leaves are curved, rigid, tetragone, mucronate . . . and that the cone-scales are . . . obtuse rhomboid and denticulated on the upper margins."

FIG. 39.—UNDER SURFACE OF LEAF OF *P. AJANENSIS*, MAGN.

Passing over numerous writers who merely copied from their predecessors, we come now to Parlato, who in his monograph intimates, by the use of the sign †, that he has seen the original specimens; and this is what he says in reference to the two points above mentioned: "Leaves slightly curved, rigid, tetragonal, mucronate, spine-tipped (pungentibus) . . . cone scales obovate, or oval orbicular . . . crosse denticulate at the margins, and with a small bract linear at the base, expanding above into an ovate acuminate blade, which is dentate and fimbriate at the margins."

Here are certain discrepancies to be reconciled or explained. Which of the above botanists was right? Were they all right? Taking the last question first, we may remark that there is only one way in which they could all be right, and that is by the supposition that we have a variable plant to deal with, so that Murray saw one variety of it, Gordon and Parlato another. But, although almost any amount of variation, according to age, locality, &c., would not surprise us, we must say that in this case there is no evidence whatever in support of such an explanation. It is, of course, possible that flat leaves and four-sided leaves might be found on the same tree, and that the cone-scales might present differences of form, but the proof that it is so in this particular case is wanting. Moreover, as we have

pointed out under *P. ajanensis*, and shall have again to mention here, there are several points of form and internal structure which lead us to the conclusion independently of documentary evidence, that we have to do with two species and not with one variable one.

We dismiss, then, the hypothesis that all were right, and have to ascertain which were right. To gain a reply to this question we had recourse to Mr. Veitch's type specimens. The evidence they afforded tallied in

FIG. 40.—PORTION OF SHOOT AND LEAVES OF *P. AJANENSIS*.

the main with the descriptions of Gordon and Parlato, but not with the original description in these pages from Veitch himself, nor with Murray's descriptions. Now this is a particularly perplexing state of things, for it involves the necessity of ascertaining, or at least endeavouring to ascertain, what the discoverer and describer really meant. It is evident that two different things have got confused by misplacement of labels, or by some mischance or other such as

FIG. 41.—*P. ALCOCKIANA*: TRANSVERSE SECTION OF LEAF, MAGN.; SCALES AND SEEDS FROM THE TYPE.

that we have to do with two distinct species, then it is clear, as we have endeavoured to show (see ante, p. 115), that one of those two is the *P. ajanensis* described in 1856, and the other may therefore be called *P. Alcockiana*, the latter specific name dating from 1861.

Hence, if our lamented friend really intended that the flat-leaved species should be called *P. Alcockiana*, his intention would have been rendered null and void by the fact that that species had been already duly named and registered four or five years previously. This would of itself lead to the application of the name *Alcockiana* to the second species—that with four-sided leaves.

Apart from this circumstance Maximowicz (whose *bicolor* represents the species with the four-sided leaves), Oldham (see his specimens), and Maries (as we learn from himself), all of whom have seen the tree in its native country, identify the tree as *P. Alcockiana*.

For these reasons, then, we apply the name *Alcockiana* to the Japanese Spruce with four-sided leaves, whose characteristics we proceed to detail.

Habit.—A lofty tree, with the habit of growth of the common Spruce.

Branches stout, rough, reddish-yellow, young shoots villosulous, cushions or "pulvini" tumid, oblong-obovate, twisted and projecting at the apex. Leaf scars rhomboid.

End-scales persistent, ovate-orbicular, convex, light brown, often with a slightly fringed edge of a darker colour.

Leaves on the leader shoots appressed, those on the lateral shoots given off on all sides all rigid, more or less curved, linear-oblong, 4-sided, deltoid or rhomboid, and flattened at the tips, green on the convex, glaucous on the concave surface, with several rows of stomata on the two lower surfaces, none on the two upper ones. On transverse section (fig. 41) the outline is more or less Pear-shaped and the hypodermic fibres are seen to be disposed evenly all round the

FIG. 42.—TRANSVERSE SECTION OF LEAF OF *P. AJANENSIS*, MAGN.

leaf. The resin canals are two in number, one on each side, just beneath the epidermis. There are no palisade cells, but the cells of the central portions of the leaf have a sinuous outline and radiate from the central vascular bundle, which latter is enclosed within a well marked sheath. (See fig. 41).

Stamens (in Maximowicz's specimen) connective, erect, suborbicular, concave, downy, denticulate.

Cones deflexed or sometimes ascending (?), 2—3 inches in length, oblong, tapering to both ends. Scales shining, brown beneath, paler above, oblong-ovate, striated, cuneate at the base, slightly rounded on the free border, and minutely toothed or subentire. Bracts in ripe cones obsolete.

Seed—Wing linear-oblong, obovate, pale brown, slightly wrapping round the seed on one side.

Hab.—According to Mr. Maries this fine timber tree occurs not only on Fusi Yama, but also in the southern parts of Japan; and if *A. Glehnii* be referable to the same species, it grows also in Sachalin.

From *P. ajanensis* the present species (figs. 41, 43) differs entirely in the form and structure of the leaves, and in the more rounded and less deeply toothed cone-scales. From *P. obovata* *P. Alcockiana* differs in its larger cones, striated crosse denticulate cone-scale, and possibly in the bract. It is highly probable that the Japanese plant is but a variety of *obovata*, but for garden purposes they are quite distinct.

The plant grown in many nurseries under the name *acicularis*, shown in fig. 43, from a plant grown at Combe Wood, belongs apparently to this species, and is indeed identified with it by Mr. Maries, but the plants at present are young, and appear less robust and more slender than the native specimens. The young shoots are glabrous, creamy-white or brownish. The leaves have the same form and structure as those of the native specimens of *Alcockiana*, but are more slender on the lateral shoots. The side leaves are given off at an angle of about 70°, those on the upper surface being nearly parallel to the long axis of the shoot. The bracts, which are not visible in the larger dried specimens of *Alcockiana*, correspond to those of *obovata*.

might so readily occur under the circumstances. Moreover, Mr. Veitch had no opportunity of putting the matter right, he being in Japan at the time the description was published, and, to the sorrow of all who knew him, no means are available for ascertaining directly which Japanese Spruce he intended to bear the name of Sir Rutherford Alcock unless we take as authoritative the specimen above-mentioned.

Botanical precedence affords a way out of this dilemma. Assuming that we are right in our opinion

According to information received from Mr. Syme, *P. Alcockiana* is the last of all the Spruces to begin growth in spring, being about two weeks later in this particular than *P. ajanensis*, so that it is probable the two plants grow at different elevations on the mountain.

For the sake of comparison we add figures of the flat leaves of *P. ajanensis* (figs. 39, 40, 42), and a magnified portion of the same, together with a transverse section of the leaf showing the curious position of the resin canals, as referred to at p. 115. The contrast with the 4-sided leaves of *P. Alcockiana* (figs. 41, 43) is well marked. *M. T. M.*

### Home Correspondence.

**Roses and the Frost.**—The question is often asked at the present time, "How do your Rose trees look?" and "How have they come out of the terrible ordeal they have had to encounter this winter?" To this I answer that I am afraid we shall find Jack Frost has committed fearful ravages amongst our pets—at least it is the case with mine (living as I do in the East of England), and especially is it so amongst the standards. I have lost all the following on standards:—Countess of Oxford, Annie Wood, Louis Van Houtte, Horace Vernet, Alfred Colomb, Marie

but this was the case with many of my trees last year, and, as a great number did not recover the shock to their system last winter, these, with many more frozen this year, will, I think, then succumb. How Roses on the Manetti have fared I am unable to say, as I have none on this stock, my soil being very heavy and cold, and it kills the tender fibres of the Manetti three months after planting. Three years ago I bought eighty plants of Mr. Walters, of Mount Radford, Exeter, and splendid trees they were, but very few were alive eight months after, and now I have not one—the roots of the Manetti rotted away. The thermometer here has fallen this winter once to zero (December 7), but many times it has registered over 20° of frost. I may mention that the shrubs are very much cut: common Laurel, Laurustinus, Sweet Bays, and Magnolias, if not quite dead, are fearfully injured—the latter, I am afraid, past recovery. I think we shall find many exhibitors of Roses when the time comes round unable to show their usual thirty-six or twenty-four, but will have to be content with a modest twelve. Perhaps other growers of Roses would give us an account of how their Roses are looking. *E. L. F.*

**Orchid Culture.**—Is it good practice, as recommended by one writer, to maintain a feeding atmosphere by means of decaying cocoa-fibre or leaves amongst the epiphytal kinds? Decay and its accompanying

the largest leaves attaining fully 18 inches in length and 5 to 6 inches in breadth. We have a plant at Ferrieres that was taken as a cutting from the parent plant last spring, and which has already attained the height of 5 feet 6 inches, the leaves measuring from 1 foot to 18 inches in length and 4 to 6 inches in breadth. The colour consists of a dark green ground with beautiful rays of cherry-rose projecting from the middle vein, becoming gradually darker as the leaves develop. It forms a splendid contrast by gas or lamp light. This plant has been to the Castle twice, where it has stayed a fortnight each time. The last time it was taken was in November, and during that time, and in fact up till now, it has never lost a leaf—making it a very useful plant for the apartments, which is very unusual for this class of plants. This *Croton*, like all others of its genus, strikes very readily from cuttings, and amateurs possessing a stove should not be without it. *W. Lovell, au Fleurist de Ferrieres-en-Brie.* [The foliage sent with this note was splendid, amongst the largest in size and richest in colouring we have yet seen. *Eds.*]

**Twin-flowered Cypripedium insigne.**—I send you a twin-flowered *Cypripedium insigne* as described by Mr. Hovey. It is cut from a plant which has borne fifty flowers, but this was the only stem which had two flowers out of that number. *G. J. Warren, Balcombe Place, Sussex.* [The flowers are very large and well developed. *Eds.*]

**Rose Stock Pruners.**—It is not easy to see how the somewhat primitive machine described by Mr. Smith at p. 182 can possess the power for removing large snags from Rose stocks, which the French machine exhibited by Messrs. Laing & Co. undoubtedly has; for, however cleverly harnessed to a bench the *scateur* may be, it is dependent entirely on the length of the handle for lever power, and thus would remove the operator further from the blade, consequently out of position to skilfully manipulate his stocks. Does Mr. Smith really mean to say that his machine can be used in many cases in which the French machine could not possibly be employed? A pair of long-handled scissors strapped to a bench does not look like a portable affair, and unless for the purpose suggested by the French word in italics, one fails to understand its additional merits. On the score of economy—and in these times, when so many calls are made on our purses, it is needful to spend money with care—and having both seen and worked the machine figured in your journal, I can with confidence affirm that it is at once the most simple and effective ever introduced. *S. B., Forest Hill.*

**Justicia flavicoma.**—As "J. S." remarks, at p. 182, this species is seldom met with in plant stoves, a circumstance that is much to be regretted considering that we are so short of yellow-flowering stove plants. We grow a quantity of it here, and find it very useful and effective when associated with such plants as *Begonia*, *Sericographis*, *Thysacanthus*, &c. *T. W. S., Buxted Park.*

**White Scale on Pines.**—If Mr. G. Clark (see p. 122) will try the following plan, I will insure him success in getting rid of the scale. Pour 6 gallons of water into a tub, let it be boiling hot. Into this put 1 lb. of soft soap. Thoroughly dissolve the soap, and let it cool down till you can put your hands in it. Roll up your sleeves, put a few suckers in the tub, and, with a small stick and a piece of linen-rag tied on it, wash every scale off with the soapy water. The secret is in this—the thoroughly washing every scale off. A thin piece of lath, with a flat point, must be used to get the scale out from the angles of the leaves. After washing, the suckers must be placed so as to drain the water out of their hearts and from the angles of the leaves. Then mix soot and sulphur pounded fine, in equal parts, which will produce a dark green powder. Make an assistant hold up a sucker, and with a sulphur puff send the mixture down into the angles of the leaves, and all over the suckers. When dry pot the suckers. A dung frame or pit is a good place in which to give them a start. The mixture of soot and sulphur does not differ much in colour from the leaves of the Pine, so that it will hardly be noticed. As I have cleaned Pines myself as above indicated, I know it will answer, as I never had a scale after, and the cost is only a few pence. *W. Hutchinson, Llanymdu Court.*

**Strawberries.**—I beg to inform Mr. Bridgman that the Strawberry plants in question were grown in the usual 32's or 7-inch pots, and that they were in no way selected as his query infers. My mode of culture is the usual one, and my plants were wintered outside plunged over the rim of the pot with leaves, and when the weather was severe a little hay was shaken over them. I have no shallow pits or perhaps these would be better; even then I would plunge them, as the roots are always in such a nice condition, and undoubtedly progressing. One point to be attended to when outside plunging is practised, is not to interfere with the

FIG. 43.—*P. ALCOCKIANA* (*EXCELSA ACICULARIS*, HORT.). (SEE P. 212.)

Rady, Marie Baumann, Charles Lefebvre, Cheshunt Hybrid, and all the Teas, although the latter were well protected with Spruce Fir boughs. I am much surprised to find Cheshunt Hybrid and Souvenir d'un Amidead, as last year, although my thermometer only once reached 9°, or 23° of frost, yet they stood it without flinching, and bloomed profusely in the summer. I have lost also a great number of dwarfs on the seedling Brier and most of the above-named sorts, with the exception of the Teas, which were well protected. It is the practice of some rosarians with whom I am acquainted to cut back their Rose trees as far as the frost has affected them, which is generally to the snow line or to the place where the mulching reaches. I cannot think that this is a good plan, for this reason, that by cutting you expose the pith of the wood, and then should another severe frost ensue, which has been the case this year, it at once penetrates right into the heart of the tree, and kills the plant altogether; whereas if the tree had not been cut back till the usual time in all probability it would have been saved. On one piece of ground I have 700 dwarf standards (maidens last summer), which seem to have escaped with very few exceptions. I attribute this to the wood being all of last year's growth, for I find in almost every case where Roses are killed that it is not the young wood of last year that is affected, but the old. I am afraid we shall find a great number of our Roses, after they have been cut back in the spring, although at the present time they seem all right, throw out a few weakly shoots, and then gracefully retire. I sincerely hope I may be wrong,

fungus are the dread of the Orchid grower, and yet we are told to bring them into our houses by means of decaying leaves; and besides, consider what quantities of insects, such as woodlice, slugs, &c., would, as a natural consequence, find their way to the plants if this practice were carried out. Has any reader of the *Gardeners' Chronicle* experience in this mode of treatment, and if so what are the results? Has it been proved to be beneficial, especially during the winter months? I am sure any particulars on this subject would be very interesting, as the culture of Orchids is increasing very much; and now it has been proved that they are not so difficult to grow as many imagine, their cultivation will become more general. Decaying cocoa-nut fibre or leaves must be quite a new element in the treatment of Orchids. *Alfred Gant, Feb. 11.*

**Croton Baronne James de Rothschild.**—Of all ornamental-leaved stove plants—except perhaps certain *Caladiums*—the *Crotons* are assuredly the most remarkable. The *Croton Baronne James de Rothschild* is a plant of free growth and bold habit. It was obtained in 1875 by MM. Chantrier et Frères, horticulteurs, à Morte-fontaine (Oise), from a cross between *C. Veitchii* and *C. maximus*, and was exhibited by them for the first time in 1877 at South Kensington, being at that time from 2 to 3 feet high, but owing to its deficiency in character it did not receive a certificate, consequently it was grown on and propagated until 1878, when it was sent out for the first time, proving to be one of the finest leaved and most vigorous growing *Crotons* then in cultivation,

soil on taking the plant indoors until it is in a healthy and workable condition. I then clean and top-dress with loam, droppings, and soot. I also use this in potting, putting a pinch over the crocks as a preventive against the ingress of worms, also a dust on the surface of the soil as a stimulant about September. I prefer watering with weak manure-water in preference to a strong dose at intervals, and I do not know that there is any manure more safe than animal manure. Guano, if too strong, will cause the plants to languish and die. One point in Strawberry culture, and an important one, is the thinning of the fruit; and the operator must keep an eye to the best sets and the stout-stemmed fruits, as these will be the weighty ones on finishing. Several of the fruits on those plants, seven and eight, would turn the scale at half a pound, and some had fifteen and twenty good fruit on a plant perhaps not worth mentioning. I have had twenty-five excellent table fruit off a variety called the Prince of Wales, but have not had the pleasure of His Highness's company of late, but for the sake of old services I trust he is not discarded. *W. Ravenhill, Gr., Boxes Manor, Southgate.*

**Humea elegans.**—I can endorse Mr. Carlton's remarks at p. 182 regarding the suitability of this plant for the decoration of the conservatory in winter. Several years ago, while serving as improver under Mr. Dunn, at Heaton Park, Manchester, I assisted in lifting a few plants out of the flower-beds; these were potted and placed in the houses and conservatory, where they made a fine display for a long time. *T. W. S., Buxted Park.*

**Soot on Boilers.**—I am exceedingly obliged to "J. S." for his endeavour to enlighten me, but as neither his theories nor those of your correspondents whom I have already referred to accord with my experience, I beg of you, Messrs. Editors, to be so kind as to give me an answer to the question I have already asked. Will a kettle or boiler (for I presume they are alike in this respect) boil quicker or slower if coated with soot? Of clean or foul flues I have said nothing, nor need "J. S." Coke is a comparatively expensive fuel either for the tubular or almost every other form of boiler. The latter information I beg to send for "J. S.'s" special consideration. *T. Challis.* [Slower certainly. Eds.]

**Grape Keeping.**—Lady Downe's keep very well indeed, and Mrs. Pince's Black Muscat has kept fairly, but are more inclined to shrivel than the former; Muscat of Alexandria began to go bad before it was ripe, as also did Black Alicante. They were cut and bottled in the first week in the new year, and although we have not a proper Grape-onger I may mention that we have kept up a supply longer than has been done in former years. *George Merritt, Gr., Kempton Hoe, Welwyn.*

**Brussels Sprouts.**—That the past ungenial season has been the cause of many failures in crops is beyond all doubt; but I think that in nine cases out of ten failures arise from growing an inferior strain, and not, as is often supposed, from any adverse procedure in the cultivation. Your correspondent's (Mr. Hinds) experience during the past summer tends to bear me out on this point. I have seen as good a crop of Sprouts from seed sown in the ordinary way with other greens, in the middle of March, as is possible to conceive, and yet we are being prompted by a correspondent in your last issue in a belief that seed sown in November is preferable to late sowings. That such may not be the case I will not dispute, but I very much question the advisability of such a course. From experience I find about the middle of the present month the best time to sow, for if sown earlier the plants are apt to get coddled, and a check must necessarily ensue which is unquestionably adverse to the well-being of the Brussels Sprouts. I always sow at the time above stated in a little heat, prick off as soon as the seedlings can be handled, retaining them in the same temperature close to the glass until established; then gradually hardening them off, and in two months from the time of sowing they are ready to be transferred to their growing quarters, which cannot be too liberally enriched. By this treatment I can, if necessary, commence picking about the middle of September. My crop thus treated last spring (in spite of the inclement season) has been all I could wish for, and I send a sample for your inspection. [Very good. Eds.] I find Scrymgeour's (true) about the best, although a sort sent out by Messrs. Cutbush & Son, of Highbury, called Cutbush's Giant, is a grand one. *E. Morgan, The Butts, Harrow-on-the-Hill.*

**Sternbergia lutea**, though a native of southern Europe, not extending in France northward of the Loire, is nevertheless a very hardy plant. Generally it flowers in September and October, but this year by exception it did not produce its flowers till nearly the middle of December, at the same time as the Christmas Rose. I have a border with some thousands

of plants in full flower now (February 2). The thermometer went down here as low as 14° C. (6° F. Fahr.), but neither the flowers nor the foliage are in the least injured. I attribute the retarded flowering of the Sternbergia to the want of heat and light in the dismal year 1879. It is a magnificent plant, doing well even in exposed places, but it prefers a dry and warm soil. Once planted it should not be disturbed, when it will multiply freely. My border has not been touched for fifteen years. *Amaryllis Atamasco* grows under the same conditions; one end of my border is filled with the plant, which produces its charming white flower in June and July. Its foliage is not injured by frost. *P. Joseph-Lafosse, Carentan, France.*

—The yellow autumnal *Crocus* usually produces its flowers in the month of October, the flowers often preceding or coming up simultaneously with the leaves. I have it now in bloom (February 4), which ratifies the statement and answers the inquiry of your correspondents "J. S." and "A.," p. 120. I attribute the cause of its not producing its flowers at the usual period last autumn to the unfavourable state of the weather; the season was so continuously wet and cold, there was not sufficient heat in the soil to mature the bulbs in the summer, and the growth of the foliage continued on until the autumn. The present appearance of the flowers arises from the fact of their formation in the bulbs without being developed; they are now being forced up with the foliage, which is much later than usual, i.e., the flowers and foliage of last October are only now being produced. I have no doubt that in warmer and drier seasons than 1879 this plant will resume its ordinary period of growth and blooming, proving the correctness of the description given of it by Messrs. Sutherland, Hemsley, and Vilmorin. *C. B. S., Jersey.*

**Early Strawberries.**—The want of sunshine during the past autumn would, it was hoped, terminate with the old year, but, so far as the present year has gone, it seems to be little improvement on its predecessor. We have now reached the end of the first week in February, and with the exception of a few hours upon two separate days we have been enveloped in comparative darkness. Early forcing, and especially Strawberry forcing, will have to be conducted with the greatest care, particularly where plants were potted rather late last autumn. It is a custom in many gardens to start the early vinery or Peach-house upon the same day in each succeeding year, and to start the first batch of Strawberries along with them. The treatment, as far as warmth and moisture is concerned, is seldom altered; the Vines are syringed according to orthodox rules, and the Strawberry plants are watered and syringed upon the same principle. In ordinary seasons this system of cultivation succeeds fairly well, but at the present time we have to calculate upon deficient maturation last autumn, and we are also face to face with a condition of the elements at the present time which will require constant and skilful attention in order to steer clear of untoward events. Some time ago I noticed symptoms in some of our earliest started plants which I knew augured no good, notwithstanding that they were kept in a temperature never exceeding 50° at night, and often falling as low as 40° at 6 A.M. The crowns seemed to be swelling quite naturally and the first young leaves began to unfold, but no flower-scape was visible. Upon a closer examination the flower truss was discovered rather behind time to my way of thinking. The house was then kept quite dry and the ventilators were opened more or less every day about 9 A.M. and kept open during the remainder of the day. Upon one or two rather bright days an increased circulation of air was admitted, and at the present time the flower-spikes are shooting up as promising as any one could desire, in advance of the leaves, a sure sign that Nature has had her time. I have no doubt that many beginners in Strawberry forcing have a large percentage of "blind plants" entirely owing to their own treatment. These blind crowns are the unhappy result of vague notions of forcing, forgetting that the work which is accomplished in a few bright days requires threefold in the time in dull weather. The reason why many people who fail with early Strawberries succeed later is because the internal development of the organs of fructification—although unseen—is so far accomplished that they readily yield to the influence of warmth when it is applied. The transition stage is passed, and with improved weather the work that required skill but a short time before gradually becomes a safe operation in the hands of the humblest tyro who can ventilate a house and use a watering-pot with anything like judgment. *W. Hinds, Canford.*

**Transmutation in Cereals.**—On the question of the changes of cereals referred to on p. 173, it may be interesting to note that it was published (and perhaps believed) in England long before Parkinson's time, whose account is quoted by Mr. Wilson. In the curious metrical translation of *Palladius on Husbandrie*,

published in 1872 by the Early English Text Society "from the unique MS. of about 1420 A.D. in Colchester Castle," are these lines:—

"Tyll all thi felde, or all thy felde is lorne;  
Thi Whete, a wonder, chaunging, thrics sowe,  
In lande to fatte, wol tourne into other corne,  
And Rie of Whete ysowen wol up growe,  
As thay that are expert in tilling knowe."

Book i., st. 24.

*Henry N. Ellacombe, Ditton Viarage.*

**Primula farinosa.**—I am much obliged to Mr. Clapham for pointing out that the words of my note on *P. farinosa* might mislead. Instead of saying it is not a mountain plant, I should have said that, in order to thrive, it seems to want level bog and not mountain. I did not, however, mean to deny or doubt its doing well at an elevation of several hundred feet above the sea level; still, it is not a mountain plant in the sense in which such plants as *Hieracium alpinum* or *Gentiana nivalis* are mountain plants. In this respect it may be classed with the *Droseras*, and *Pinguicula vulgaris*, and *Parnassia palustris*, which are essentially bog plants, but accidentally mountain plants, because bogs and mountains are often associated. The sentence in question was worded as it is, because in a recent standard work on the British Flora I find "mountain pastures" given as the only habitat of *P. farinosa*, and I have elsewhere seen it called the "Mountain Primrose." I have never heard that it is confined to limestone soils, though I have seen it about here only on limestone. It is curious that it does not occur in the mountain limestone district of North Wales or North Derbyshire, where there are many spots which would seem exactly to suit it. Some seedlings of *P. farinosa* fertilised with pollen of *P. japonica*, raised in a garden here, produced flowers so nearly resembling those of *P. amoena*, that a good botanist to whom they were sent named them *P. amoena*. It must be observed that *P. amoena* is quite distinct from *P. cortusoides amoena*, with which it has lately been sometimes confused. *C. W. Dod.*

**Staging Orchids.**—Most Orchids are undoubtedly very beautiful, but I have repeatedly heard people remark on entering a house that everything around them appears so artificial and formal that their quaintness and beauty is to a great extent destroyed. If, instead of the straight stages, paths, and numerous rows of pots which continually meet the eye, Orchid-growers were to turn their attention more to the natural fernery style of arranging their plants it would, I think, be a step in the right direction. Let irregular rockwork of stones and burnt clay replace the iron and wood stages at present in use, and so formed that when the plants are in position but few pots can be seen. The stems of dead Tree Ferns, cut in lengths of from 1 to 4 feet, make capital stands to dot about, and I know of nothing which shows a suitable Orchid off to greater advantage. A *Phalenopsis* placed on one of these, standing in a carpet of moss, cannot be left unnoticed, because it looks so natural and refreshing. Pots made to represent the trunks of trees cut in different lengths, and the branches lopped off some inches from the stems and perforated numerous with holes, appear to me more suitable, and display the natural habits of the plants to greater advantage, than the smooth turned pots now in use. Blocks of this description were largely used ten or twelve years ago by Mr. Sherratt, then gardener to J. Bateman, Esq., Knypersley, in preference to wood, because there was no fear of fungus. In building a stage of rockwork of course it would be necessary to have the plants as near the glass as possible; but that would easily be done, and suitable places made where Orchids could to a certain extent occupy positions analogous to those they are found in by travellers and collectors. To give a finished appearance to the whole, and form a carpet, a liberal distribution of *Adiantum cuneatum* and *Selaginella Kraussiana* would prove the best subjects, as they are liable to but few insects. As Orchids are now arranged, we notice on entering a house a mass of bloom of every conceivable form and colour, and in our haste to see all at the same time we rush here and there, and in the end see—or at least remember—but little. But if we came upon their beauty by degrees, and in every corner something interesting was seen, and every projecting stone disclosed to view something grand, then would be kindled in every breast such an interest that the desire to know more of their history and culture would become irresistible. Take for instance a group of *Cypripediums* plunged in moss, and overhanging from a crevice a plant of *Dendrobium Wardianum* with say a dozen well-bloomed growths, each 4 feet in length, and no one would deny that the plants are seen to greater advantage than if the *Cypripediums* were standing on slates, and the *Dendrobium* hanging over a tile floor. *A. L. H.*

**Art in the Conservatory.**—I have read Mr. Adams' reply to my letter, and I am pleased to find

that when he gives the proper aspect of a span-roofed vinery as east and west his meaning is that it should be placed north and south. The phraseology is somewhat confusing and unusual, which has led me to attribute to it a different meaning. My reading of the article was taken from the *Building News*, where it appeared on January 16 and 23, and not from any of your gardening contemporaries, as Mr. Adams supposes. I regret that upon the other point referred to, my rules for obtaining the proper quantity of piping to keep up a given temperature, I am not able to agree with him. I pointed out in my former letter that the more elaborate rule given was copied from Mr. Hood's work. Mr. Adams says in his reply, "Taking the . . . simpler rule I gave." Will he be surprised to learn that this simpler rule is also copied from Hood, and is, as well as the other, more than forty years old (see *Hood*, first edition, 1837, pp. 17 to 25). Mr. Hood evidently was a man of great ability and research, to whom all horticulturists and heating engineers are much indebted, and as he himself, in his preface to the later editions points out, it is very unfair to borrow rules and tables from his work "without acknowledgment." Mr. Adams departs from Hood when he gives 26° as being low enough for ordinary calculations: Hood gives 10°. On the principle that the weakest link measures the strength of the chain, even 10° is not low enough. We have had in Roxburghshire and Berwickshire in December last a temperature of 15° below zero. Mr. Thomson, Clovenfords, if I remember rightly, registered 12° below zero; therefore it is necessary, in Scotland at least, to take a much lower figure than even 10°. In the winter of 1878-79 we had it repeatedly below zero, so that, instead of (as Mr. Adams says) experiencing this severe cold once in ten years, if so often, ten times in two years is nearer the truth; therefore, to take 26° Fahr. as our basis for calculating our heating apparatus when we have experienced a temperature of 30° or 40° lower is surely misleading. What the qualifications of Mr. Burden of Loughborough may be I know not, but have every reason to believe they are what is represented; at the same time I think Mr. Burden will not be slow to admit—as indeed all must admit who have looked at the subject—that the two rules quoted by Mr. Adams are, to say the least of it, contradictory to a large extent. Mr. Adams gives another rule, but "neither in this does his witnesses agree." Let us apply this last rule of his friend's to the span vinery as formerly, with 1200 feet of glass = 1500 feet per minute. The rule, multiply the glass in feet (1500) by eleven times the required difference between the outside (always taken at 32°) and inside temperatures 70° (38°), and divide by fifteen times the intended difference between the temperature of the water (always 180°) and the air of the house (70°), 110°, thus —  $38 \times 11 = 418 \times 1500 = 627,000 \div 110 \times 15 = 1650 = 380$  feet of pipe. Three rules are given—one gives 452 feet, another 380, another 270. But if we are to fix upon a temperature, say 26° to suit our rule, I have no doubt the figures may be made to correspond. I think, however, we should endeavour to find a rule to suit our temperatures rather than fix upon a certain temperature to suit our rules. And I hold that whatever our rules are—to be safe, at least for Scotland and the North of England—we must fix upon a point as low as zero. Allow me to say that I look upon Mr. Adams' paper as a most able and, as far as could be expected in the circumstances, an exhaustive treatment of the subject as a whole, from which no doubt good results will flow; and, notwithstanding anything said in either of my letters, I am very glad indeed to have had the opportunity of reading it. *A. D. Mackenzie, 2, Grove Terrace, Edinburgh.*

**Scirpus parvulus in Surrey.**—Dr. E. de Crespigny has sent me specimens of the above plant, gathered last autumn on the banks of the Thames above Hammersmith Bridge. Mr. H. C. Watson confirms the name. The history of this species as a British plant is somewhat interesting; for many years it was supposed to be extinct, until Mr. A. G. More found it in Ireland in 1868. The following dates will show the long interval between its first discovery as a British species and the then quickly following records:

Near Lymington, Hampshire . . .	1837 . . .	Rev. G. E. Smith.
Mouth of the River Ovoca . . .	1868 . . .	Mr. A. G. More.
Wicklow, Ireland . . .	1868 . . .	Mr. A. G. More.
Little Sea, Studland, Dorsetshire . . .	1870 . . .	Mr. Mansell-Pleydell.
Near Aveton Gifford, Devonshire . . .	1878 . . .	Mr. Archer Briggs.
Near Newton Abbot, Devonshire . . .	1879 . . .	Mr. Archer Briggs.
Banks of the Thames, Surrey . . .	1879 . . .	Dr. E. de Crespigny.

It is found in Europe from Gothland southwards, exclusive of Turkey and Spain (Hooker, *Student's Flora*), inland in Switzerland (Mr. H. C. Watson). *A. Bennett, Croydon.*

**Plant Labels.**—The use of petroleum-oil for dipping wood labels is also useful for preserving and painting them. I put some oil in a vessel and drop the bundle of labels into it, have ready beside me a

lump of ground white lead, on to which I dab the label; one movement of the finger covers it with paint, and it is ready for use. *A. Booty, Rose Villa Nursery, Harrogate, Feb. 4.*

**Uprooting of Conifers.**—Mr. Cuiverwell (p. 182), in recommending the surface-dressing of the ground under these trees has, in my judgment, hit the right nail on the head, except that I do not agree with him in placing it round the stem or collar of the tree, as in many instances that would, if done indiscriminately, kill the tree. Surface-rooting trees like the Conifers are wonderfully benefited by soil placed over the roots, and if I remember rightly that veteran in the Pinetum, Mr. Frost of Dropmore, often surfaces his plants. Certain it is that at once nourishes the roots and steadies the tree. Thirty years ago a good deal of levelling was done in the garden here, and 2 feet of soil had to be laid over the roots of a Cedar, bricks were placed round the tree 1½ foot clear of the stem, and then the earth was placed over the roots and up to this brickwork, but not a spadeful inside; the result is that it is now a magnificent tree of eighty summers. What a pity the *Cedrus Libani* and *atlantica* are not more planted: there is not a tree of the former 250 years old in this country, and yet what magnificent specimens one sees occasionally. But I must hark back to my surface-dressing: well, at the same time and place a quantity of soil had to be carted out into the park, it was spread round a deciduous tree, I forget whether Beech or Sycamore, but there was no protection to the collar of this tree, and the result was that it died the same summer; therefore my advice in planting Conifers is to plant high, then they can be surfaced with impunity without covering the collar. *J. Rust, Eridge Castle.*

Reports of Societies.

**Royal Horticultural: Feb. 10.**—At the annual general meeting of the Society, held on Tuesday, the President, Lord Aberdare, occupied the chair, the other members of the Council present being Messrs. Strickland, Lawrence, M.P., Grote, Denny, Webb, Clarke, Mason, and Hogg (secretary). The Assistant-Secretary, Mr. Jennings, having read the notices calling the meeting, as required by the charter, proceeded to read the minutes of the last annual meeting, which were duly confirmed and signed by the Chairman. Mr. John Lee and Mr. James F. West were then appointed scrutineers of the ballot, and on the motion of the President the report of the Council, which was published in our last issue (p. 184), was taken as read.

Lord Aberdare in moving the adoption of the report said with respect to the present position of the Society, that the Council considered it their duty to remain in possession of the gardens as long as they could, in order to protect the interests of the debenture-holders until the Chancery suit now pending between Her Majesty's Commissioners and the Society had been decided, as he believed it would be during the present month. What the results of the litigation in question might be, was of course very uncertain, and it was not advisable under the circumstances to further discuss the matter at present; but it was clearly the duty of the Society to leave no stone unturned to get the best terms they could both for the debenture-holders as well as themselves. With regard to the past year, it had been an unfortunate one all round, and doubly so in their case. The fortnightly meetings had, however, been of an unusually excellent character; still, the stars in their courses had fought against them; the Council had sowed liberally, but had reaped badly, their receipts not coming up to their expenditure by about £600. They had, however, some resources to fall back upon, which would enable them to start the year without any great burden upon their shoulders, but that would no longer justify them in running any risks. A good deal of the expenditure of the past year was of an exceptional character, and while the income derived from subscriptions had fallen off they had a set-off against this loss—a gain of about £200 more than usual derived from the sale of garden produce at Chiswick. The Society had also spent £200 more on medals than in the previous year, and the new printed list of Fellows, which was badly wanted, had cost them £60. The disastrous hailstorm on August 3 had also necessitated an expenditure of £140 at Chiswick to make good the damage, and they had been obliged to put in a new boiler to heat the large conservatory at a cost of £120. Still, with a proper regard to economy, he had no doubt they would this year be able to balance their accounts. With regard to the income derived from Fellows' subscriptions it should be remembered that they had suspended entrance-fees, and that the new Fellows had only to pay the annual subscription—a circumstance which he trusted would lead to an accession during the year of a greater number of new members. Alluding again to the Chancery suit, the

President stated that it must not be inferred if the decision went against the Society that the severance of the connection between the Society and the Commissioners would necessarily follow, and concluded by moving the adoption of the report.

Mr. Guedalla, in a lengthy speech, wanting in point and cohesion, strongly deprecated the action of Her Majesty's Commissioners, and thought it would have been much better had they met a deputation from the debenture-holders, and discussed the points upon which the basis of a settlement of the claims of the latter could have been arrived at. He also referred to the action taken by Mr. Wills with reference to the proposal for holding an international horticultural exhibition this year, and blamed the Council for not supporting him, and the Commissioners for not granting the use of the gardens; on which point Sir Trevor Lawrence explained that at a meeting held to consider the advisability of holding the exhibition in question, a majority decided that it was inexpedient to do so; and Lord Aberdare stated, with reference to the supposed opposition of the Commissioners, that that body knew nothing about the matter.

After a few remarks from Mr. Wheble, the Chairman put the vote to the meeting, and the adoption of the report was carried unanimously. The balloting list for members of Council and office-bearers, nominated by the Council, was next declared to have been unanimously accepted by the Fellows; and Mr. W. B. Kellock asked a question with reference to the item in the balance-sheet referring to the life compositions; and further, whether the £100 paid to the Assistant-Secretary, as Editor of the *Journal*, formed part of Mr. Jennings' stipulated salary, or was in addition to it?

Lord Aberdare replied that as Mr. Kellock had been a former member of the Council he ought to know why the item referring to the life compositions appeared there now, as it had done during his membership, and with reference to the £100 that it formed part of Mr. Jennings' regular salary.

Mr. Liggins moved a vote of thanks to the Council for the action they had taken to defend the interests of the Society in the Chancery suit instituted by Her Majesty's Commissioners, which was seconded and carried unanimously; and the usual vote of thanks to the Chairman brought the proceedings to a close.

**SCIENTIFIC COMMITTEE.**—Dr. Maxwell Masters, F.R.S., in the chair.

**Ash Root.**—The Chairman reported that he had examined the Ash root submitted to him at a former meeting, and had found that the main cause of the deformity was attributable to the great increase in thickness of the corky layers of the rind. No trace of fungus had been seen.

**Phylloera at the Cape.**—Mr. MacLachlan stated that he had examined specimens sent from the Cape of diseased Vines, but without finding any trace of the insect. He adverted to the folly of indulging in panic, particularly where, as in this case, there was no basis for it. The Chairman remarked that it had been reported that the Cape Government had actually enacted or were about to enact a law absolutely prohibiting the importation of any living plants whatever beyond their frontier; and he suggested that the Council of the Society might be appropriately requested to take steps to urge on the Colonial Government the useless folly of such an enactment. Considerable discussion ensued, the Chairman and others giving their experience of the working of similar laws in Italy and Spain. Opinion was unanimous as to the futile character of such enactments, and as to their absurdity when applied to plants other than Vines, but as to official remonstrance on the part of the Society it was considered better to await full official information.

**Peach Twigs and Galvanised Wire.**—Mr. Hudson, gr., Gunnersbury House, Acton, sent some shoots of Peach trees, which had apparently been injured by being tied to galvanised wire. This is a subject upon which there has been much discussion. The specimens sent were referred to Dr. Hogg and the Rev. George Henslow for examination and report.

**Specimens Shown.**—By Mr. Rann: Flower-spike of *Dasyliro glaucophyllum*, and male spike of *Encephalartos villosus*. By Messrs. Veitch: specimens of *Nepenthes bicalcarata* (see p. 201). By Mr. Cannell: a Primrose, supposed to have originated in a cross between the English magenta-coloured hybrid Primrose and the Chinese form. The plant exhibited was of peculiar aspect, dwarf habit, and with small flowers. Some of the petals were lilac, others deep magenta, others variously blotched and spotted. The foliage and the stems were of the character of the Chinese form.

**New Species of Crocus.**—Mr. Maw then read his paper on this subject, and illustrated it with numerous exquisite coloured drawings. The paper will appear *in extenso* in the *Journal* of the Society, and is specially interesting, not only for the large number of new species described, but also for the valuable notes on structure and geographical distribution by which they were accompanied, and the discrimination

shown in the unravelling of the synonymy of the older and less known species.

**FLORAL COMMITTEE.**—Mr. Charles Noble in the chair. But few novelties of any value came before the committee to-day, and three certificates only were awarded. Mr. Bull contributed a choice little group, as usual, which included, besides Palms and other handsome foliaged plants, a small specimen of *Psychotria cyanococca*, with a cluster of small blue fruit; a flowering specimen, the first we have seen, of *Tillandsia musaica*; the pretty new *Cymbidium Lowianum*, with a spike of nine flowers; flowering plants of *Lycaste Skinneri*, and its varieties *rubella* and *candida*; *Cattleya Trianae* var. *Vesta*, *Odontoglossum cirrosum*, &c. A Bronze Medal was recommended. From Messrs. James Veitch & Sons came an excellent group of Cyclamens, and a small collection of new plants, which included the new Bornean *Nepenthes bicarata*, two new hybrid *Ochids*, and one or two seedling *Amaryllis*. The Hon. and Rev. J. T. Boscawen, Lamorran Rectory, Probus, sent a seedling *Amaryllis*, named *Beauty of Cornwall*, a medium-sized, deep blood-red flower, with the margins of the segments wavy. Mr. Cannell brought up from Swanley individual flowers of twenty distinct varieties of *Primula sinensis*, though only a few of them were of first-rate quality. Mr. Cannell also showed a group of white *Primula* plants growing in 48-pots, bearing from three to four good trusses of flowers on each, and measuring across the top from 12 to 18 inches. They were in every respect admirable, and shown to-day to illustrate the virtues as a fertiliser of "Cannell's Invigorator," or food for plants. Mr. H. B. Smith, of Ealing Dean, showed several plants of the distinct and pretty pale rose-flowered *Cyclamen persicum* named *Rosy Morn*, which was certificated two years ago. Mr. Chambers, Westlake Nursery, Isleworth, showed a small but profusely flowered specimen of *Cœlogyne cristata*; and Mr. E. Wilson, gr. to T. Farmer Hall, Esq., Effingham House, near Leatherhead, showed a nicely flowered *Dendrobium chrysotomum*. Messrs. Osborn & Sons, Fulham, showed a group of fine-foliaged and forced flowering plants. Cut flowers of *Cineraria Webbiana*, a rosy-purple-flowered species from the Canary Islands; and of the deep blue-flowered *Salvia albo-cœrulea*, were contributed by Mr. Green, gr. to Sir George Macleay; and of *Maranta Warszewiczii*, by Mr. Hudson, gr. to H. J. Atkinson, Esq., Acton.

**NEW PLANTS CERTIFICATED.**

First-class Certificates were awarded to Messrs. James Veitch & Sons, for *Nepenthes bicarata*, a Bornean species, introduced by Mr. Burbidge, and which is figured and described in another column (p. 200); for *D. splendidissimum* x, a hybrid between *D. heterocarpum* and either *D. macropyllum* *Huttoni* or *D. nobile*, with sepals and petals cream-coloured and tipped with purple, and the lip yellow with a blackish-purple blotch at the base; and for *Daphne Blagayana*, a new Styrian species, with ivory-white sweet-scented flowers, arranged in a terminal cluster, immediately below being a circlet of small green leaves.

**FRUIT COMMITTEE.**—Henry Webb, Esq. in the chair. The most interesting subject which came under the notice of this committee was a sample of new Black Hamburg Grapes, shown by Mr. Stevens, of Trentham, good in size, and well coloured, accompanied by a sample of a late last year's crop of the same variety, which, although in an excellent state of preservation, were not to be compared with the former for flavour and appearance. To produce such Grapes in the second week in February, and especially in such a winter, is a most creditable performance, which we think deserves high praise, and something more than the Cultural Commendation that was awarded. Mr. L. Killick, Langley, near Maidstone, exhibited a collection of sixty varieties of Apples, all in excellent preservation, and most of them above the average quality of last season. The award of a Silver Knightian Medal was recommended. He also exhibited a nice dish of Vick's Criterion Tomato; and Mr. H. A. Mann, The Gardens, St. Vincent, Grantham, sent a sample of large Mushrooms.

**The Weather.**

**LONDON: Barometer.**—During the week ending Saturday, February 7, in the vicinity of London the reading of the barometer at the level of the sea decreased from 30.37 inches at the beginning of the week to 30.33 inches by the evening of the 1st; increased to 30.46 inches by the morning of the 3d, and steadily decreased to 29.49 inches by the end of the week. The mean value for the week at sea level was 30.16 inches, being 0.13 inch below that of the preceding week, and 0.20 inch above the average.

**Temperature.**—The highest temperatures of the air

observed by day varied from 48° on the 7th to 41° on the 4th; the mean value for the week was 46°. The lowest temperatures of the air observed by night varied from 23½° on the 2d, and 24½° on the 5th, to 41° on the 7th; the mean value for the week was 31½°. The mean daily range of temperature in the week was 14½°; the greatest range in the day being 24° on the 2d, and the least 7°, on the 7th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Feb. 1, 35°, -3°.6; 2d, 35°.8, -2°.9; 3d, 40°, +1°.2; 4th, 35°.8, -3°.1; 5th, 34°.4, -4°.6; 6th, 42°.9, +3°.8; 7th, 45°, +5°.9. The mean temperature of the air for the week was 38½°, being 4° below the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 97° on the 5th, 84° on the 2d, and 83° on the 4th; on the 3d the reading did not rise above 49°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 18° on the 2d, 20° on the 1st and 5th, and 21° on the 4th. The mean of the seven lowest readings was 27°.

**Wind.**—The direction of the wind was S.W. and its strength almost calm, except on the 6th and 7th, when it was moderately strong.

The weather during the week was somewhat fine, though generally dull, and the sky cloudy.

Very dense fogs were prevalent during the first part of the week, that on Wednesday night being unusually dense.

Rain fell on three days during the week; the amount measured was 0.34 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, February 7, the highest temperatures of the air observed by day were above 53° at Truro, Sheffield, Leeds, and Sunderland, and below 50° at Brighton, Blackheath (London), Norwich, Wolverhampton, and Hull; the mean value for the week from all stations was 51½°. The lowest temperatures of the air observed by night were below 30° at Truro, Brighton, Blackheath, Cambridge, Nottingham, Liverpool, Leeds, and Bradford, and above 35° at Plymouth and Sunderland; the mean value from all places was 29½°. The extreme range of temperature in the week was above 25° at Cambridge and Leeds, and below 16° at Brighton and Plymouth; the mean range from all stations was 21½°.

The mean of the seven high day temperatures was above 50° at Truro, Plymouth, Sheffield, Liverpool, Leeds, and Sunderland, and below 45° at Brighton and Wolverhampton; the general mean from all places was 48½°. The mean of the seven low night temperatures was below 35° at Blackheath, Brighton, Wolverhampton, Nottingham, and Leeds, and above 40° at Truro and Plymouth; the mean from all stations was 36½°. The mean daily range of temperature in the week was above 14½° at Blackheath and Leeds, and below 10° at Plymouth, Brighton, and Hull; the mean daily range from all places was 12°.

The mean temperature of the air for the week from all stations was 42°, being 3½° higher than the value for the corresponding week in 1879. The mean temperature was above 45° at Truro, Plymouth, and Sunderland, and below 40° at Brighton, Blackheath, Wolverhampton, and Nottingham.

**Rain.**—The amounts of rain measured at the several places varied from three-fourths of an inch at both Truro and Brighton, to two-hundredths of an inch at Sunderland; at Bradford no rain fell; the average fall over the country was 0.30 inch.

The weather during the week was generally dull and cold, and the sky cloudy. Dense fogs were prevalent everywhere.

**SCOTLAND: Temperature.**—During the week ending Saturday, February 7, the highest temperatures of the air observed by day varied from 55½° at Edinburgh and Leith, to 50° at Dundee; the mean value from all places was 53°. The lowest temperatures of the air observed by night varied from 35½° at Edinburgh and Aberdeen, to 41° at Paisley; the mean value from all stations was 36½°. The mean range of temperature in the week from all places was 16½°.

The mean temperature of the air for the week from all stations was 45°, being 8° higher than the value for the corresponding week in 1879. The mean temperature was above 46° at Paisley and Leith, and below 45° at Dundee, Aberdeen, and Greenock.

**Rain.**—The heaviest falls of rain were 1.17 inch at Greenock and 0.91 inch at Perth; and the least falls were 0.05 inch at Aberdeen and 0.41 inch at Glasgow; the average fall over the country was 0.68 inch.

**DUBLIN.**—The highest temperature of the air observed by day was 56½°, the lowest observed by night was 28½°, the extreme range was 28½°, the mean was 45½°; and the fall of rain was 0.80 inch.

**STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 11, 1880.**

- Feb 5.—Fine and bright till evening, overcast afterwards. Some fog and hoar-frost in morning. Cold.
- 6.—Generally dull and cloudy. Fine at intervals in morning. Overcast, and a little rain at night.
- 7.—A dull, overcast, wet day. Miserable. Mild. Damp.
- 8.—Overcast in morning, fine bright afternoon. Smart shower of hail at 6 P.M. Cloudless afterwards. Heavy rain in early morning.
- 9.—Fine and bright till 2 P.M., overcast afterwards. Rain in early morning, and frequently in afternoon and evening. Strong wind.
- 10.—A fine bright day, partially cloudy. Cooler. Overcast at night.
- 11.—A dull, cloudy day. Cold. Fine and cloudless at night.

JAMES GLAISHER, F.R.S.

**Variorum.**

**THE WHISTLING TREE.**—In Nubia and the Soudan groves of a species of *Acacia* are described as existing whose scientific appellation, as well as their popular name, is derived from a peculiar sound emitted by the branches when swayed by the wind. The Arabic name is the "soffar," or pipe; and the specific name of *fistula*, also meaning a pipe, has been given to it for the same reason as that which prompted the natives to give it its local designation. The tree is infested with insects, whose eggs are deposited in the young shoots and extremities of the branches. A sort of gall-like excrescence about an inch in diameter is produced at the base of these shoots, and when the larva has emerged from this nidus it leaves a small circular hole, the action of the wind in which causes it to produce a whistling sound like that produced by a flute, or by blowing into any hollow pipe. When the wind is violent, the noise caused by thousands of these natural flutes in a grove of *Acacias* is most remarkable. The description given by Dr. Schweinfurth of these "bladder-like galls" leaves it uncertain whether they are true gall-nuts or whether they are the secretion of a species of lac insect. The valuable Indian lac insect thrives on two or three species of *Acacia*, while one variety (the *A. arabica*) also produces a kind of pod or gall-nut, which is useful for tanning. In either case, these natural "whistles" of the Whistling Tree would form a valuable article of commerce if they could be easily and regularly collected and exported. *The Colonies and India.*

**Enquiries.**

*He that questioneth much shall learn much.*—BACON.

**WOOD SUITABLE FOR CONSTRUCTING VINERIES, &c.**—Will some correspondent oblige by furnishing me with his experience as regards the suitability of Scotch Fir and Larch for employment in the building of vineries, &c.? H. 7.

**Answers to Correspondents.**

**APPLE TWIGS: E. H. S.** The specks you mention are natural formations to certain varieties. They are botanically "lenticels," consisting in local thickening of the cork layer of the bark. At least this is the interpretation we put on them, but we have not examined them microscopically.

**BEDDING-OUT: Countryman.** You should apply at once to either Mr. Gibson, at Hyde Park; Mr. Roger, at Battersea Park; Mr. McIntyre, at Victoria Park; or Mr. Brown, at Regent's Park. This is the best time of the year for making the change you propose.

**CLEMATIS INDIVISA: R.** It may be propagated by grafting on the roots in March.

CROQUET GROUND: A. B. Sow the ground with an admixture of good grasses, not with any one kind. The sorts we should recommend are Lolium perenne tenuis, Poa trivialis, Cynosurus cristatus, Festuca ovina and duriuscula, Trisetum flavescens, and Agrostis stolonifera, with a little Dutch Clover. If these are thoroughly mixed over the ground they will soon produce a good turf, but you must give it time to acquire compactness of growth.

"ESTATES ROLL": H. P. Published by Messrs. Dowsett & Woods, 70, Lincoln's Inn Fields, W.C.

FORESTS OF SOUTH AFRICA: J. D. You will get much information from the Rev. Dr. Crombie Brown's books on Forests and Moisture (Oliver & Boyd), and on the Hydrology of South Africa (King & Co.).

NAMES OF FRUIT: Veritas. We do not recognise your Apple.—A. O. E. 1, Belle Apres Noel; 2, Franc Réal d'Hiver; 3, Beurré Diel; 4, Beurré de Rance; 6, Glon Moreceau.

NAME OF FUNGUS: J. Hart. The fungus from Kingston, Jamaica, is Polyporus lucidus, which is almost cosmopolitan. M. J. B.

NAMES OF PLANTS: T. H. Meggy. One of the many forms of Ilex Aquifolium, allied to maderense.—H. Powell. Helleborus olympicus; one of the earliest blooming sorts.—H. J. Ross. Your names appear to be correct.—J. C. 1, Adiantum curvatum; 2, Selaginella Martensii; 3, Eranthemum aureo-reticulatum.—T. P. G. Begonia semperflorans; Anomum Cardamomum.—Enquirer, Haydock. 1, Cattleya labiata; 2, sent to Prof. Reichenbach for identification; 3, Angrecum eburneum.—H. C. 1, Drosera binata; 2, Lycopodium varium; 3, Grevillea buxifolia; 4, Drosera peltata; 5, Darwinia fascicularis; 6, Xerotes glauca.

Markets.

COVENT GARDEN, February 12.

Trade has been very quiet during the week, and the demand for any but the best class of goods has been slow. American Apples still arrive in large quantities, but not of such satisfactory quality as they have been. Good samples of home-grown cooking varieties are in request. Large consignments of St. Michael Pines have been reaching us, prices realised being exceptionally low. James Webber, Wholesale Apple Market.

PLANTS IN POTS.

Table listing various plants in pots such as Arum Lilies, Azaleas, Begonias, Bouvardias, Cinerarias, Cyclamens, Cyperus, Dracena terminalis, Erica gracilis, Eupomys, and Ferns, with prices in s. d. s. d.

CUT FLOWERS.

VEGETABLES.

Table listing vegetables such as Artichokes, Asparagus, Beet, Brussels Sprouts, Cabbages, Carrots, Cauliflowers, Celery, Chilis, Cucumbers, Endive, Garlic, Herbs, Potatoes, and Turnips, with prices in s. d. s. d.

SEEDS.

LONDON: Feb. 11.—Messrs. John Shaw & Sons, 37, Mark Lane, state that nothing new or interesting has occurred this week in connection with the trade for foreign seeds. As regards red Clover the supply continues abundant, but the demand is meagre. From the Board of Trade returns, just published, it appears that the imports into the United Kingdom of Clover and grass seeds amounted during the past month to £99,967, against £78,153 for January, 1879. There is no quotable variation in either Alsike or white Clover. Trefloils are quiet. Perennial and Italian Rye-grasses firm. For Tares there is a brisk sale at full rates. Bird seeds meet a slow inquiry. Haricots, Lentils, and Peas continue cheap.

CORN.

The trade at Mark Lane on Monday was quiet, but the tone a trifle firmer. The better qualities of English Wheat moved off quietly on former terms, and foreign Wheat was held for full prices. Barley was dull, especially feeding qualities. Malt was quiet, and without alteration. Oats were a trifle firmer than on Friday, but on the week there is a reduction of about 3d. per quarter. Maize showed no material change. Beans and Peas were dull, and quotations ruled in buyers' favour. The flour market was inactive, and prices were somewhat easier as compared with Monday's night.—Trade was steady on Wednesday. The holders of Wheat were rather firm, and business altogether was quiet. Barley was very slow of sale, as also was Malt. Oats and Maize found few buyers, and prices were much the same as on Monday. Beans, Peas, and flour were taken off to a limited extent on former terms.—Average prices of corn for the week ending Feb. 7:—Wheat, 44s. 2d.; Barley, 36s. 10d.; Oats, 21s. 3d. For the corresponding period last year:—Wheat, 38s. 1d.; Barley, 35s. 7d.; Oats, 20s.

CATTLE.

At the Metropolitan Market on Monday trade in beasts was excessively dull, prices being also lower for all kinds, and many inferior lots remained unsold. Trade in sheep was very dull, and only for choicest qualities were our top quotations obtained. Calves were scarce and dear. Quotations:—Beasts, 4s. to 4s. 8d., and 5s. 2d. to 5s. 8d.; calves, 5s. to 6s. 8d.; sheep, 4s. 8d. to 5s. 4d., and 5s. 8d. to 6s. 6d.; pigs, 3s. 8d. to 4s. 6d.—Thursday's cattle trade was in a dull and weak state. Supplies were only moderate, but sufficient for the demand. The tendency throughout was adverse, both as regards beasts and sheep.

HAY.

Tuesday's Whitechapel Market report states that superior fodder was very slow of sale, but prices showed no material change. Prime Clover, 100s. to 124s.; inferior, 70s. to 95s.; prime meadow hay, 80s. to 94s.; inferior, 30s. to 70s.; and straw, 30s. to 37s. per load.—On Thursday there was a moderate supply of hay and straw on sale. The trade was dull, but there was no material change in prices.—Cumberland Market quotations:—Superior meadow hay, 95s. to 105s.; inferior, 40s. to 76s.; superior Clover, 115s. to 126s.; inferior, 75s. to 95s.; and straw, 34s. to 40s. per load.

POTATOS.

From the Borough and Spitalfields Markets reports we learn that the demand for all sound Potatoes remains pretty good, and prices may be quoted firm. Scotch Regents, 146s. to 165s.; do. Champions, 140s. to 150s.; Lincoln Regents, 140s. to 155s.; Victorias, 160s. to 190s. per ton. German reds, 6s. 6d. to 7s. 6d. per bag; Belgian kidneys, 6s. to 6s. 8d.; French whites, 4s. 9d. to 5s.—Last week's imports into London were 390 bags from Malta, 439 bags from Rotterdam, 537 bags from Dantzic, 3189 bags from Hamburg, and 2763 barrels from Nova Scotia.

Government Stock.—The closing price of Consols on Monday was 97 1/4 to 98 for both account and delivery. The same figures were recorded on Tuesday and Wednesday. Thursday's final quotations were, for the account, 97 1/4 to 98 1/4, and for delivery, 98 1/4 to 98.

Wandsworth Common and Garret Lane Nurseries.

R. AND G. NEAL beg to call the attention of Gentlemen, Builders, and the Trade to their large and varied Stock of HARDY ORNAMENTAL, FOREST, FRUIT TREES, ROSES, SHRUBS, &c., grown at their Nurseries, which comprise 70 Acres of a remarkable collection of those Plants and Trees most suitable for growing in or near large towns. BEECH, 2 to 3 feet and 3 to 4 feet.

ELM, 3 to 4 feet, 4 to 5 feet, and 5 to 6 feet.

SYCAMORE, 2 to 3 feet, 4 to 6 feet, and 6 to 8 feet.

CHESTNUT, Horse, 3 to 4 feet, 6 to 8 feet, and 8 to 10 feet.

LIMES, 4 to 6 feet, 6 to 8 feet, and 8 to 10 feet, fine.

POPLAR, Black Italian, 2 to 3 feet and 3 to 4 feet.

To the Trade.

Thimbleby, February 3, 1880.

Windsor Nurseries, Putney, S.W.

To GENTLEMEN, BUILDERS, and the TRADE.

S. MAHOOD AND SON have to offer a

large stock of HARDY and ORNAMENTAL SHRUBS and TREES, in great variety, comprising Hollies, Cupressus, Thujopsis, Cedrus Deodora, Box Trees, &c., 6 to 8 feet high, good specimens; a large quantity of smaller Shrubs, Aucubas, Portugal Laurels, &c.; several thousand Ives, from 4 to 8 feet, good strong plants in pots. All in good condition for moving, and at low prices.

An inspection invited.

TREES FOR AVENUE, PARK, or, STREET PLANTING.

ACER DASYCARPUM, 14 to 16 feet, girding 5 to 7 inches.

CHESTNUT, Horse, 12 to 14 feet, girding 5 to 7 inches.

.. Horse, 14 to 16 feet, girding 8 to 10 inches.

.. Horse, Scarlet, 10 to 14 feet, girding 6 to 8 inches.

LIMES, 14, 15, 16, 18, and 20 feet, girding 6 to 10 inches.

PLANES, Occidental, 10 to 12 feet, girding 4 to 5 inches.

.. Occidental, 12 to 14 feet, girding 5 to 6 inches.

A few hundred splendid PLANES, 16 to 18 feet, girding 8 to 10 inches.

POPULUS CANADENSIS NOVA, 12 to 14 feet, girding 6 inches.

MAPLES, Norway, 12 to 16 feet.

BEECH, Purple, 10 to 12 feet.

OAKS, Scarlet, 10 to 12 feet.

CHESTNUTS, Spanish, 10 to 12 feet.

SYCAMORE, 12 to 15 feet.

They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe.

The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive.

ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

**NICOTIANA LONGIFLORA.**—A deliciously fragrant plant with pure white flowers; one will scent a whole house; easily cultivated, almost perpetual bloomer. Packet of seeds, with cultural directions, price 7d. Stamps with order.—W. J. MARSH, Woodbridge, Suffolk.

## THE SCOTTISH CHAMPION POTATO.

THE CHAMPION POTATO has been most appropriately named, for, in Scotland at all events, it has thoroughly beaten every other variety in disease-resisting properties, and has lately been lifted at the rate of 10 to 12 tons an imperial acre, grown as an ordinary field crop. Having paid much attention to the Champion since it first appeared, we can fully endorse all that has been said in its praise, and certainly the past unfavourable season has proved it to be the most valuable introduction of the last few years. It originally came from Forfarshire, and, after trial, was recommended in the Lawson Seed List of 1875. In general appearance it comes between the Scotch Regent and the Irish Rock, embodying the good qualities of the former and the hardy constitution of the latter. Like other Potatoes, its eating quality varies according to circumstances as regards soil, climate, and cultivation, but it may safely be classed among good table sorts. The Champion is a strong, rank grower, and should be allowed a fourth more space at least than that which ordinary kinds require in planting. It is, perhaps, the latest field Potato to ripen, the haulm remaining fresh when that of all others is withered. It should, consequently, be planted earlier than is usual for late sorts generally in order to do it justice. It will grow remarkably well on poor soils where other kinds would not succeed, and altogether it is highly recommended for a main crop in every garden and farm. It cannot, however, be too prominently kept in view that to fortify its disease-resisting character a thorough change of seed is necessary.

We are now prepared to book Orders for fine Seed samples of the true variety, either for present or future delivery. Price per Bush, Cwt., or Ton upon application.

**COALS FOR HOTHOUSE PURPOSES.**

**WOOD AND CO.'S STAR ANTHRACITE SMOKELESS STEAM COAL** is now being extensively used by many of the principal Growers, and is found to be preferable to any other kind of fuel in respect to cheapness and durability, and particularly on account of its being perfectly free from sulphur, and that it does not clinker the fire-bars. **WOOD AND CO.** deliver in truckloads to any Railway Station, prices for which can be had on application, or can be delivered by **Wood & Co.'s Vans** (in the Metropolis). **WOOD AND CO.** append a testimonial given to them by Messrs. Beckwith & Sons, a firm of great experience, and who have kindly allowed them to make whatever use of it they may think fit.

Tottenham Nurseries, London, N., Dec. 28, 1877. To Messrs. Wood & Co. Dear Sirs,—With reference to your enquiry respecting the "Star" Anthracite Coal with which you supplied us—as to how it suited, its economy or otherwise—we have much pleasure in informing you that in every respect it is the best Anthracite we have ever used. We find there is no smoke from it, which is very essential, and there is no trace of sulphur. It requires very little stoking, and leaves very little ash, and certainly does not clinker. Our consumption of coal is about 500 tons a year, and we have no hesitation in saying that, by using your "Star" Coal in the place of ordinary fuel, we shall effect a saving of at least £100 this year. We attribute this to the powerful and lasting properties of your Coal.—Yours faithfully, (Signed) G. BECKWITH & SONS.

**WOOD AND CO.** supply all kinds of Coal for House and Manufacturing purposes, in single truckloads, to any Railway Station, at Wholesale rates, prices for which will be sent on application. **WOOD AND CO.,** Coal and Coke Factors, Merchants, Contractors to Her Majesty's Government, 58, Coal Exchange, E.C.; and 4, Coal Department, Great Northern Railway, King's Cross, N.; and Midland Sidings, St. Pancras, N.W.; 94, High Street, Kensington; London, Chatham and Dover Railway Coal Depot, Elephant and Castle; and Great Northern Railway Coal Depot, Sydney Road, Hackney Wick, E.

Referring to **MESSRS. WEEKS'S** advertisement in the "Gardeners' Chronicle" of January 24, wherein appears a challenge to all who doubt the superiority of their Tubular Boilers, I would ask by what means they would arrive at the conclusion as to which Boiler was best, supposing I or any other person or persons interested in this matter were to pit any special form of Boiler against theirs?

If **MESSRS. WEEKS** will kindly reply and say, and the test be a fair one, I have every reason to believe the challenge will be duly accepted.

**JOSEPH BRAMHAM,**  
Hot-water Engineer, &c.,  
104, Dale Street,  
Liverpool.

**GARDENER (HEAD, WORKING).**—Age 30, single; thoroughly experienced in the Cultivation of Stove and Greenhouse Plants, also Orchids, Pines, Grapes, Early and Late Forcing of Fruits, Flowers and Vegetables, and the General Management of a Private Establishment. Can be well recommended.—A. M. MEADOW, Swanton Novers, Dereham, Norfolk.

**GARDENER (HEAD, WORKING),** where two or three, or more are kept; no objection to a small comfortable place.—Middle-aged, one child (age 13) at home; has had many years of good practical experience in all branches of Gardening. Wife could, if required, assist in House occasionally, or take entire charge in absence of family. Has been in present place 13 years. Leaving in consequence of the establishment being reduced.—Any Lady or Gentleman requiring the services of a steady, sober, trustworthy Gardener, will oblige by applying at once to H. M., Greenhill Gardens, Sutton Veny, Warminster, Wilts.

**GARDENER (HEAD), or GARDENER and STEWARD.**—A most respectable married man is at liberty to engage with any Nobleman or Gentleman requiring the services of a first-class man, thoroughly experienced in all branches of his business. Has had the management of large establishments in Ireland. Good accountant, trustworthy, and confidential. English, Protestant.—ALPHA, W. B. Hartland, Seedsman, 19, Princess Street, Cork.

**GARDENER (HEAD, or SINGLE-HANDED).**—Age 35, with small family; Land and Stock if required. Thoroughly competent, with good character.—W. Mr. Woods, Crocer, Godstone Station, Surrey.

**GARDENER (SINGLE-HANDED, or where another is kept).**—Age 26, single; understands Early and Late Forcing, Flower and Kitchen Gardening, Stove and Greenhouse.—BINSTEAD, the Post Office, Titchfield, Hants.

**GARDENER.**—A GENTLEMAN can highly recommend a young man (age 27), to assist in the Garden.—HERBERT STRUB, Esq., Makeney, near Derby.

**GARDENER.**—Age 32, married; understands Stove and Greenhouse Plants, Flower and Kitchen Gardening, Vines, Melons and Cucumbers.—A. D., Gardner, Wareham, Wells, Norfolk.

**GARDENER (where one or two are kept),** to any Lady or Gentleman requiring the services of a steady, energetic, and trustworthy man.—Age 35, married; has a sound practical experience of twenty years' standing in all branches of the profession. First-class testimonials as to character and abilities.—W. C., Mrs. Williams, Northern Common, Dronfield, Woodhouse, Derbyshire.

**GARDENER (SECOND), in the Houses,** under the Foreman.—Age 25, single; eleven years' experience. Good character and references.—HEAD GARDENER, The Pollards, Loughton, Essex.

**GARDENER (SECOND, or good JOURNEYMAN).**—Age 24; ten years' experience. First-class character from present and previous places.—M. H., 27, Newcombe Street, Kensington, W.

**GARDENER (SECOND, or UNDER).**—Age 27; Indoor and Out if required. Seven years' experience. Total abstainer. Please state wages.—C. SEYMOUR, Marsh Street, Walthamstow.

**GARDENER (UNDER).**—Steady, respectable, sober young man. Good character.—J. C., The Lodge, Adderbury, Oxon.

**GARDENER (UNDER).**—Age 24, respectable. Bothy preferred.—T. K., The Gardens, Felcourt, East Griestead, Sussex.

**GARDENER (UNDER), in a Gentleman's Garden,** where others are kept.—Age 20; good character.—W. H., 5, Agnes Cottages, Old Farthing Lane, Wandsworth, London, S.W.

**GARDENER (UNDER, or THIRD), in a large establishment.**—Age 19; four years' experience in the Houses. Good character.—Mr. W. NASH, The Gardens, Bryogwyn Park, Hereford.

**FOREMAN, in the Houses.**—Mr. SIMPSON, Norman Court, Salisbury, will be pleased to recommend to any Gardener a young man as above.

**FOREMAN, in a good establishment.**—Age 24; has had experience in Vines, Pines, Melons, Cucumbers, Stove and Greenhouse Plants. Good references.—A., The Gardens, Aldenham Abbey, Watford, Herts.

**FOREMAN, in the Houses in a good private establishment.**—Age 23; can be highly recommended by present employer.—F. R., The Gardens, Holme Island, Grange-over-Sands, Lancashire.

**FOREMAN, in the Houses, in a Nobleman's or Gentleman's establishment.**—Age 26; understands his work. Good references.—G. B., 7 Cornwall Terrace, Catford, Kent, S.E.

**FOREMAN, in a good general place.**—Age 22; eight years' experience in several good places.—J. B., Mr. Townsend, New Road, Barnet, Herts.

**FOREMAN, in a good establishment.**—Age 25; ten years' experience in all branches of the profession. First-class testimonials.—C. H. P., The Gardens, Bishop's Wood House, near Ross, Herefordshire.

**FOREMAN, in a good establishment.**—Age 24; thoroughly understands Stove and Greenhouse Plants, Vines, Peaches, Melons, and Cucumbers. Good references as to character and ability.—J. HUGHES, The Gardens, Heanor Hall, Heanor, near Derby.

**FOREMAN.**—Age 24; has had practical experience with Orchids, Stove, Greenhouse, and other Plants; Pines, Vines, Melons, and other Fruits; Early and Late Forcing, Pruning, and is a good Propagator. Good reference from last place in same capacity.—W. T., Royal Vineyard Nursery, Hammersmith, W.

**FOREMAN, in a good gardening establishment.**—Age 26, single; has filled responsible situations as Foreman, and can be highly recommended by present and previous employers as a good practical man, who is interested in his profession. Accustomed to first-class Fruit and Plant growing under Glass (including Pines), Funnishing, and Gardening generally. Where a collection of Orchids are grown preferred.—FOREMAN, Messrs. Atkinson & Hasselby, 1, Baxtergate, Doncaster.

**FOREMAN (INSIDE).**—Messrs. CUTBUSH & Son can with confidence recommend a young man as above; has held a similar situation before. First-class Fruit and Plant Grower.—W. WILSON, Barnet Nurseries, New Road, High Barnet, Herts.

**FOREMAN (GENERAL), and PROPAGATOR (OUTDOORS).**—Age 32; well versed in Roses, Fruit Trees, &c. Good references.—Apply to J. B., 14, Nellfield Place, Aberdeen.

To Nurserymen.

**FOREMAN, or GROWER.**—Well up in Forcing Cut Flowers for Covent Garden Market. A good Plantsman. Thirteen years' experience, as above, in Middlesex. Good references.—WM. BRIGHTON, Harlesden Green, N.W.

To the Trade.

**FOREMAN and GROWER of Hard or Soft-wooded Plants, Cut Flowers, Cucumbers, &c. (Pelargoniums, Bouvardias, Double Primula, special).**—Age 40; eighteen years in the Market trade. Good references.—G. G., 3, Burlington Cottages, Steyne, Acton, W.

**FOREMAN (or good SECOND).**—Age 23; eight years' experience Inside and Out. First-class references.—G. T., 1, Lea Road, Fairfield, Beckenham, Kent

**FOREMAN (or good SECOND), in a Nobleman's or Gentleman's Establishment.**—Age 25. Good references from late employers.—K. H., 43, Thornhill Place, Maidstone, Kent.

**NURSERY FOREMAN.**—Many years' experience with Fruit Trees, &c. Good recommendation.—W. C., 44, Estcourt Road, Fulham, S.W.

To Nurserymen.

**NURSERY FOREMAN, MANAGER, or TRAVELLER.**—Good experience Indoor and Out.—H., Messrs. Hurst & Sons, Seed Merchants, Leadenhall Street, London, E.C.

To the Trade.

**MANAGER, GENERAL FOREMAN, and CORRESPONDENT, in a first-class General Business.**—Age 35; twenty-two years' experience. First-class references. State salary, &c.—J. R., 36, Grove Road, Clapham Junction, S.W.

**JOURNEYMAN, in the Houses.**—Age 20. Three years' character.—J. B., Smith's Library, Great Western Railway Station, Windsor.

**JOURNEYMAN, under Glass.**—Age 21, single; two years' good character from last place.—A. LEAVER, Great Coxwell, near Faringdon, Berks.

**JOURNEYMAN, in a good establishment.**—Age 18; good character.—W. WALLEN, The Gardens, Bonningtons, Ware, Herts.

**JOURNEYMAN, in a first-class establishment.**—Age 18; four years' experience. No objection to pay Premium.—HENRY SURMAN, Florist, Witney, Oxon.

**JOURNEYMAN, in a good establishment.**—Age 21; seven years' experience. First-class character.—G. S., 5, Railway Terrace, Slough, Bucks.

**JOURNEYMAN, in a Gentleman's establishment or Nursery.**—Age 32; good reference.—C. H., 2, Hartfield Villa, Hartfield Road, New Wimbledon, Surrey.

**JOURNEYMAN, in the Houses.**—Age 20; five years' experience. Good reference.—E. U., Mr. Beeson, 23, St. John's Road, Leamington.

**JOURNEYMAN, in the Houses.**—Age 22; thorough practical and persevering young man. Three years' good character from present situation.—I. HEATH, 3, Compton Cottages, Hartland Road, Isleworth, W.

**JOURNEYMAN, in a private establishment, to assist in the Houses, and to attend Fires.** Willing to learn and make himself useful. Can be highly recommended.—S. D., A. S. Board, Post Office, near Great Western Railway Station, Acton.

**JOURNEYMAN.**—A young man, active and steady; used to the work of Forcing, Vines, Figs, &c., Propagating Plants of the Flower Garden, and Designing and Planting-out Beds. Good testimonials.—J. L., Mr. Cooper, Nurseryman, Hackwood Road, Basingstoke, Hants.

**JOURNEYMAN, in a Gentleman's establishment.**—An active, respectable young man, accustomed to the work of Plants and Forcing Houses, propagating Plants, &c. Can have good character.—HEAD GARDENER, Effingham Park, Crawley Down, Crawley, Sussex.

**PAINTER.**—A young Man is desirous of a permanent situation in a Nobleman's or Gentleman's Garden or Estate. Has served an apprenticeship to Painting, Gasing, Paperhanging, and Plumbing, and has some years' experience as Journeyman. Good character. Can be highly recommended.—W. FLETCHER, The Gardens, Moss Bank, Bolton.

**KINAHAN'S LL WHISKY.**

**KINAHAN'S LL WHISKY.** Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.

**KINAHAN'S LL WHISKY.** Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."

**KINAHAN'S LL WHISKY.** Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

**EPPS'S COCOA.**

**GRATEFUL AND COMFORTING.**

“By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame.”—*Civil Service Gazette.*

JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,** and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

More Remarkable Cures of Asthmatic and Consumptive Coughs and Throat and Chest Diseases by

**DR. LOCOCK'S PULMONIC WAFERS.**—From Mr. JOHNSON, M.P.S., 191, Meanwood Road, Leeds, February 2, 1880.—“I recommend the Wafers in cases of Asthmatic and Consumptive Coughs, with the most beneficial results, and I also consider them the best medicine for all Throat and Chest Diseases.” Price 1s. 1/2d. per box.

**HOLLOWAY'S PILLS.**—Enfeebled Existence.—This medicine embraces every attribute required in a general and domestic remedy; it overturns the foundations of disease laid by defective food and impure air. In obstructions or Congestions of the Liver, Lungs, Bowels, or any other organs, these Pills are especially serviceable and eminently successful. They should be kept in readiness in every family, as they are a medicine without a fault for young persons and those of feeble constitutions. They never cause pain, or irritate the most sensitive nerves, or most tender bowels. Holloway's Pills are the best known Purifiers of the Blood, and the best promoters of absorption and secretion, and remove all poisonous and obnoxious particles from both solids and fluids.

**CARTERS'**

**DISEASE-RESISTING**

**POTATOS**

FOR PLANTING.

IMPORTANT CAUTION.

**CARTERS' IMPROVED MAGNUM BONUM POTATO.**

This variety was selected from the old MAGNUM BONUM purchased in 1877 by Messrs. CARTER direct from the raiser, Mr. CLARKE. Messrs. CARTER find it necessary to issue this caution, as it has come to their knowledge that Potatoes have been sold as CARTERS' IMPROVED MAGNUM BONUM, but which were a spurious and very inferior kind. Orders now being booked for delivery in strict rotation. Early Orders recommended.

Price, per Sack, 33s.; per Bushel, 12s.  
MUCH CHEAPER PER TON.

**CARTERS' SELECT STOCK OF SCOTCH CHAMPION.**

Awarded a First-class Certificate by the Royal Horticultural Society,

with the following remarks:—"The Committee were of opinion that the 'Scotch Champion' Potato was remarkable for resisting the disease, and is a Potato of good quality."

Price, per Sack, 28s.; per Bushel, 10s. 6d.  
MUCH CHEAPER PER TON.

**"A Change of Seed always Pays."**

JAMES CARTER & CO. have just received, ex S.S. "Sunbeam," a large consignment of the following varieties of AMERICAN-GROWN POTATOS, selected for them from the finest crops of the year:—

SNOWFLAKE  
BRESEE'S PEERLESS  
EARLY ROSE  
LATE ROSE

Lowest Price per Barrel on application.

They are offered in Barrels, weighing about 168 lb. each, as received (as Messrs. CARTER do not Hand-pick these POTATOS, in the usual manner), and they must be taken with any risks and imperfections.

20s. value Carriage Free. | 5 per Cent. for Cash.

**Carters**

THE QUEEN'S SEEDSMEN,  
HIGH HOLBORN, LONDON, W.C.

The Manufacturers of this valuable Manure have thought it best, up to the present time, not to publish any Testimonials, knowing well that the greater number that have been published are, if not quite untrue, certainly greatly exaggerated. They think, however, the opinion of a gentleman with such a reputation and large experience as Mr. A. F. Barron, will be considered especially valuable:—

"Royal Horticultural Society's Gardens, Chiswick.

"Jan. 21, 1880.

"Gentlemen—I am using your Fertiliser, and think very highly of it.

"A. F. BARRON.

"Messrs. Clay & Levesley."

A List of One Hundred of the most eminent Nurserymen, Florists and Gardeners, who have permitted us to state that they are using this Manure with the most successful results, will be forwarded on application.

Sold in Packets 1s. each, and in Bags,

¼ Cwt. ½ Cwt. 1 Cwt.  
7s. 6d. 12s. 6d. 20s.

**GOOD THINGS.**  
*All the Season.*

FLOWER SEEDS.

CHOICEST OF THE CHOICE.

OWN SAID.

H. CANNELL wishes to announce that his Illustrated CATALOGUE of 60 Pages and upwards of 100 Engravings, exclusively devoted to Flowers, is now ready, and sent post-free. Its practical information, especially for Amateurs, far surpasses anything of the kind ever issued, and the Seeds that he has for Sale are certainly the best ever offered.

*Come and See.*

How I Grow and Save them.

THE above is now admitted throughout the world to be the most replete Illustrated and Descriptive CATALOGUE of Florists' Flowers and their Seeds ever issued. No garden of the least pretence should be without this work; even the professional refers to it for guidance, as it describes all the best varieties (new and old) in cultivation, supplied either as Cuttings, Rooted Cuttings, or Plants, at the lowest price consistent with correctness.

**COLEUS.**

CUTTINGS of 24 splendid New kinds, my selection, for 5s. 24 Best Older varieties, 2s. 6d.

The best new and perfectly distinct Coleus for the year are WOODHOUSE'S AUSTRALIAN VARIETIES. (\*First-class Certificate from the Floral Committee of the Royal Horticultural Society.)

NEAL** beg to call the attention of Gentlemen, Builders, and the Trade to their large and varied Stock of HARDY ORNAMENTAL, FOREST, FRUIT TREES, ROSES, SHRUBS, &c., grown at their Nurseries, which comprise 70 Acres of a remarkable collection of those Plants and Trees most suitable for growing in or near large towns. An early inspection is solicited.

All goods delivered free on rail in London or at own residence within six miles of the Nurseries.

CATALOGUES free by post on application.

New Catalogue for 1880

W. M. CLIBRAN AND SON, The Oldfield Nurseries, Altrincham, Cheshire, will have great pleasure in sending their **DESCRIPTIVE PRICED LIST** upon application. Their stock of Florists' Flowers, Bedding and Soft-wooded Plants generally, is surpassed by none either in extent or quality, all the newest and best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to purchasers is that none of the Plants offered are taken from a warm propagating-house and sent off immediately, but are all carefully hardened, and most of them potted off singly, and are thereby fitted for transit by post or rail without the slightest injury. A great proportion of the under-mentioned are autumn-struck plants, and can be had in pots if required, and all in a variety of sorts and colours, all good for exhibition or home decoration:—

TO THE TRADE ONLY.

NEW DWARF KIDNEY BEAN,  
"THE MONSTER,"  
OR MAMMOTH LONG-PODDED NEGRO.

Was awarded a First-class Certificate by the Royal Horticultural Society,  
on August 26, 1879.

This is one of the most valuable varieties that has been introduced of late years. It differs from the ordinary type in having much larger pods, and in being more productive and very early. It is of robust habit, and the pods, which are produced freely and continuously, range from 7 to 8 inches in length, and are very fleshy.

OFFERED THIS SEASON FOR THE FIRST TIME.

In Sealed half-pint Packets, 2s. 6d., or by post, 2s. 9d.

Retail of the principal Seedsmen in the United Kingdom. Wholesale only of

HURST & SON,

NEW SCOTCH CHAMPION.—True. Fine sample, extraordinarily productive, and marvellous disease-resister	2 0	7 0	13 0	12 0
PORTER'S EXCELSIOR.—Fine quality, good cropper	2 6	8 0	15 0	14 0

Good Peck Bags charged 3d. each, Bushels 6d., and Common Sacks, to hold 1½ Cwt., 8d. each.  
ASPARAGUS PLANTS, splendid stuff, Battersea and Connover's Colossal, 1s. 6d., 2s. 6d., and 5s. per 100; 10s. to 40s. per 1000.  
RHUBARB, splendid for planting, large Victoria, Early Scarlet, and Prince Albert, 2s. to 4s. per dozen; 10s. to 20s. per 1000. Price varying according to size.  
Superior CABBAGE and SAVOY PLANTS, from F. GEE'S noted stocks. Good plants are scarce and dear. F. GEE can still supply a limited quantity of fine stuff, as follows:—  
EARLY ENFIELD, and others, 5s. per 1000.  
DRUMHEADS, 4s. per 1000.  
RED DUTCH, fine, 7s. 6d. per 1000.  
GREEN CURLED SAVOY, very fine, 5s. per 1000.  
Packages for Cabbage Plants, 6d. per 1000 extra.  
And CATALOGUES and lowest prices also of FARM and GARDEN SEEDS, on application to  
F. GEE, Highgate, Beds.

Special Trade Offer.  
MANETTI STOCKS, extra strong, fit for immediate grafting, very fine, 40s per 1000; 1-yr. from cuttings, fit for budding this summer, 30s per 1000, £12 10s. per 10,000.  
Dwarf ROSES, 30s. per 100; ASPARAGUS, 1-yr., Connover's Colossal, 10s. per 1000; 2-yr., do., 15s per 1000; Grayson's Giant ASPARAGUS, 1-yr., 7s 6d. per 1000; 2-yr., 12s. 6d. per 1000; 3-yr., 25s per 1000. Nett cash with orders.  
R. LOCKE, Rose Farm, Redhill, Surrey.

SEED POTATOS.—Myatt's Prolific, Royal Ashleaf, Gloucester Kidney, Erin's Queen, Mona's Pride, Veitch's Ashleaf, Old Ashleaf, Scotch Regents, Scotch Champion, Early Rose, Early Vermont, Red-skinned Flourball International Kidney, Schoolmaster, Trophy, Triumph, Prince, &c. Fine samples. Price on application to  
G. BRAMLEY, Hambleton, near Selby, Yorkshire.

To the Trade.  
PRIMROSE, Double Lilac, 12s. 6d. per 100, £5 per 1000; Double White, 12s. 6d. per 100, £5 per 1000. Special offer to clear ground.  
RODGER McCLELLAND AND CO., 64, Hill Street, Newry.

Packington Nursery.  
1 mile from Ashby-de-la-Zouch Station.  
WM. WALKER has 3000 or 4000 TREE BOX to offer to the Trade, 3 to 4½ feet high, at 16s. per 100; likewise a quantity 15 to 18 inches, in cutting bed, at 8s. per 100. Also Common and Portugal LAUREL; Red, White, and Black CURRANTS, &c. Prices on application.

Must be Cleared.  
ASPARAGUS.—Fine clean Roots, 2-yr. and 3-yr., the latter very strong. Samples and prices of  
FREEMAN AND FREEMAN, Upper Market, Norwich.

FRUITING PLANTS  
of PEACHES, NECTARINES, APRICOTS, and GRAPE VINES, a large and fine stock, now offered for Sale.  
THOMAS RIVERS AND SON, Sawbridgeworth, Herts.

MAGNUM BONUM POTATOS.—A splendid sample of the above, grown from Seed, direct from the raiser (Mr. Clarke), price 7s. 6d. per bushel of 56 lb., free on rail, sacks included. Also about 10,000 strong HAZEL, at 15s. per 1000.  
H. T. BATH, Seedsman, &c., 80, High Street, Lymington.

QUICKS.—Whitethorn, extra strong, well-rooted, 1½ to 3 feet, 3-yr., at 14s. per 1000 (nett): about 300,000.  
P.S. Price LISTS of Herbaceous and Alpine Plants, Fruit Trees, &c.; also CATALOGUES of Kitchen Garden, Flower, and Agricultural Seeds, at very moderate prices, post-free on application.  
W. BALL AND CO., Seed Growers and Nurserymen, Bedford Road, Northampton.

Stock Plants.  
GERANIUMS.—Stock Plants of New and valuable Geraniums with cuttings, for cash.  
The magnificent new Silver-edged Geraniums, with grand flowers of all colours, strong plants 4s. 6d. per dozen, 25s. per 100, packed and put on rail. Strong rooted cuttings of all the best sorts 3s. per dozen, or 18s. per 100, by post. Cuttings 10s. 6d. per 100, post-free.  
LISTS free on application. P.O.O. payable to  
CHARLES BURLEY, Nurseries, &c., Brentwood, Essex.

# BOILERS, BURGHLEY HOUSE GARDENS.

THE SEAT OF THE MOST NOBLE THE MARQUIS OF EXETER.

Mr. Gilbert writes as follows:—

"Ten Years ago we put down two of Weeks's Patent Upright Tubular Boilers to replace eleven of the then Improved forms of Saddle Boilers, to which 8000 feet of Piping is attached. We find one Boiler sufficient to work the entire apparatus, except in very severe weather, when we use both. Weeks's Boilers are staunch Gardeners' Friends. They keep our minds at ease, and consequently prevent our hair turning grey. I may add that our Boilers have not cost One Shilling for Repairs since the time they were fixed."

*New and Enlarged Book of Designs (15th Edition) and full particulars of Boilers sent, post-free, on application.*

**J. WEEKS & CO.,**  
HORTICULTURAL BUILDERS AND HOT-WATER ENGINEERS,  
KING'S ROAD, CHELSEA, LONDON, S.W.

TWO GOLD MEDALS  
Awarded to us by  
Royal Horticultural Society.

At the Grand Show at Preston  
July, 1878,  
Out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the *only firm* in the kingdom that has ever been awarded *Two Gold Medals* by the Royal Horticultural Society, this will be some proof of the quality of our productions. Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last

a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the paint the best genuine white lead and oil. HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

**R. HALLIDAY & CO., Royal Horticultural Works, MIDDLETON, MANCHESTER.**

## WORKS FOR THE POSSESSORS OF GARDENS.

### HIGH CLASS KITCHEN GARDENING.

A Handy Manual for the Improved Cultivation of all Vegetables. By WILLIAM EARLEY, Author of "How to Grow Mushrooms," "How to Grow Asparagus," &c., &c. Crown 8vo, with Coloured Frontispiece. Price 4s. 6d.

MRS. LOUDON'S LADIES' COMPANION TO THE FLOWER GARDEN. A complete Guide to the Management and Adornment of Gardens of every size. A New Edition. Fcap. cloth. Price 7s.

### ON GROWING ROSES OUT-OF-DOORS.

By Rev. O. FISHER. Third Edition. Price 6d.

### HOW TO GROW MUSHROOMS.

By WILLIAM EARLEY. Price 1s. stitched.

### HOW TO GROW ASPARAGUS.

A Popular Explanation of the best Method of Culture. By WILLIAM EARLEY. Price 1s. stitched.

London: BRADBURY, AGNEW & CO., Bouverie Street, E.C.

## NOVELTIES IN VEGETABLE and FLOWER SEEDS.

All Seeds (except Beans and Peas) post-free.  
Five per Cent. Discount for Cash. 20s. value carriage free.

OUR SEED FARMS are the largest in the Kingdom, being upwards of 1200 Acres in extent.

### WEBBS' MATCHLESS BRUSSELS SPROUTS.

Unequaled for general use.  
6d. and 1s. per Packet, post-free.

### WEBBS' PERPETUAL BEARER CUCUMBER.

The best and most reliable variety.  
1s. 6d. and 2s. 6d. per Packet, post-free.

### WEBBS' NEW SUMMERHILL LETTUCE.

A splendid and distinct Cabbage Lettuce.  
6d. and 1s. per Packet, post-free.

### WEBBS' BANBURY ONION.

The best Onion for the main crop.  
6d. and 1s. per Packet, post-free.

### WEBBS' WOODFIELD MELON.

The finest green-fleshed variety ever brought before the public.  
2s. 6d. per Packet, post-free.

### WEBBS' NEW EARLY PURPLE-TOP TURNIP.

The best and earliest Garden Turnip.  
1s. per Packet, post-free.

### WEBBS' NEW "TRIUMPH" PEA.

The best Pea for the general crop.  
3s. per Quart.

### WEBBS' SUPERB CALCEOLARIA.

The finest strain in cultivation.  
2s. 6d. and 5s. per Packet, post-free.

### WEBBS' NEW DOUBLE CINERARIA.

An excellent plant for decorative purposes.  
2s. 6d. and 5s. per Packet, post-free.

### WEBBS' EXQUISITE PRIMULA.

A strain of unsurpassed excellence.  
1s. 6d. and 2s. 6d. per Packet, post-free.

### WEBBS' NEW PETUNIA.

Cannot be too highly recommended.  
2s. 6d. per Packet, post-free.

### WEBBS' EXCELSIOR GLOXINIA.

A magnificent variety, of fine form.  
1s. 6d. and 2s. 6d. per Packet, post-free.

### WEBBS' SUPERB CINERARIA.

The finest strain in cultivation.  
2s. 6d. and 5s. per Packet, post-free.

### WEBBS' PERFECTION CYCLAMEN.

A superior strain of this exquisite plant.  
1s. 6d. and 2s. 6d. per Packet, post-free.

For full particulars of the above and other Standard Novelties, see

THE

## Gardeners' Chronicle.

SATURDAY, FEBRUARY 21, 1880.

### NURSERY STOCK.

THERE are some economic aspects of the nursery trade of a very interesting, instructive, and, indeed, a startling character. When we think of the hundreds of thousands of the commoner plants grown in nurseries, and forming in many of these establishments the staple stock cultivated—and when we consider the vast quantities of these raised annually, the question naturally arises how they are obtained in such myriads. Let any one look through a catalogue of common nursery stock, such as the Hazel, Laurel, Hawthorn, Larch, Spruce Fir, Oak, Ash, &c., and think what quantities of these are annually required for planting, and the necessity for their production in huge numbers is at once apparent. It is not a common practice throughout the nursery trade to grow these plants from seed. But few lay themselves out to produce; the large majority buy in stock in a young state from the producers, and plant up in vacant ground for their own consumption. It would not pay many of them to grow from seed; they cannot spare the ground, which they devote to more remunerative crops; and so it has come to pass that there are in the nursery trade those who lay themselves out to supply what others find it better to purchase than to raise for themselves.

Northampton is one among many places where one of these manufacturing nurseries is to be found, viz., that of Messrs. Thomas Perkins & Sons. The soil is well adapted for the culture of plants for covert and forest, as well as for ordinary plantations. It is a substantial red loam of great depth, resting on ironstone, and in it all kinds of nursery plants, and especially fruit trees, grow well, throwing out fibrous roots that soon attach themselves to the soil when transplanted. The Kingsthorpe Nursery, on the road to Leicester, is many acres in extent, the same red loamy soil extending throughout; and there is this peculiarity about it—that the labourers can work on it at any time, as rain passes so quickly away from the surface. It is a soil, however, that needs plenty of feeding to keep it in good character for generous growth.

### QUICK, OR HAWTHORN.

Common Quick, or Hawthorn, is raised here in immense quantities. In 1875—a good year for tree and bush seeds of all kinds—as many as 1250 bushels of haws were obtained and sown; and it is worthy of note that the crop has been an indifferent one since. This large quantity was obtained from extensive Crown lands in the county of Northampton, and there are always those who gather the berries in the proper season and sell them to the growers. In a season like that of 1875, when the berries are plentiful, they can be purchased as low as 1s. per bushel, but when they are at all scarce prices rule higher. The berries are procured in autumn, and then buried in pits in the same

way as Potatos, after being well turned over previously to cause them to rot. This is done to induce germination: the shell, being very hard, has to be softened before the cotyledons will issue from it. From one to two millions of plants are raised annually, the crop being regulated by the quantity of berries obtained.

In the nurseries Hawthorn is transplanted when one year old, and sold when two or three years old: what is unsold in the third year is again transplanted. When young the Hawthorn grows very rapidly, if planted in good ground. Its rapid growth makes it useful for hedgerows, and if well pruned and kept down when young, it quickly grows into a thick and intricately woven hedge. When it arrives at the height of a tree, however, it makes wood very slowly, and lives to a great age. Its beauty and picturesqueness, as conducive to a charming feature in the landscape, entitle it to high consideration. It is of a dense leafy growth; its snowy blossoms are often produced in such quantities as to completely whiten the whole head of the tree, and which in the case of the common, as well as of some of the choice sorts, have a delightful perfume, while in autumn and winter the ruddy crimson-coloured haws give the plant a rich and glowing appearance in our forests, open glades, and thickets. It is largely planted as covert for game.

"The English Hawthorn," remarks Mr. A. J. Downing, in his book on *Landscape Gardening*, "is not only a beautiful small tree, but it is connected in our minds with all the elegant poetic and legendary associations which belong to it in England, for scarcely any tree is richer in such than this. With the floral games of May this plant, from its blooming at that period and being the favourite of the season, has become so identified that the blossoms are known in many parts of Britain chiefly by that name. Among the ancient Greeks and Romans they were dedicated to Flora, whose festival began on the first of that month, and in the olden times of merry England the Maypole, its top decked with the gayest garlands of these blossoms, was raised amid the shouts of the young and old assembled to celebrate the happy rustic festival." One variety, the Glastonbury Thorn, which in favourable seasons and situations blooms as early as Christmas, and in January or February, is well known because of the popular legend attached to it by the monks of the dark ages.

#### HAZEL NUTS.

The Hazel or common Nut of the woods is raised in large quantities, from 400,000 to 500,000 annually, when there is a good crop of Nuts. In 1875, when Nuts were plentiful, 100 bushels were sown, obtained from the woods in Northampton, Leicestershire, &c. They are sown broadcast in prepared beds as soon as they can be obtained in the autumn. If the Nuts are kept long before sowing a kind of hard skin or filament gathers about the kernel, and prevents it from germinating. When English wood-nuts are plentiful, as they were five years ago, they can be purchased at 3s. per bushel; when they are scarce the price is much higher. It is sometimes necessary to purchase Spanish Nuts for sowing, at something like 10s. per bushel, but this is only necessary when English Nuts are not forthcoming. The seedlings are transplanted the following autumn, and sold generally when three years old, the plants averaging 3 feet in height.

The Hazel is extensively grown for coppice wood in some parts of England, in Sussex and Kent it is much used for this purpose; and rods formed of the strongest growths of a few years are used for making hoops, and the stouter wood for burning for charcoal. "The male catkins make their appearance in September, on the previous year's shoots, but are not fully developed or expanded until the succeeding season, when the female flowers appear, about

February 1, and in April they are in full bloom. These are small, and of a beautiful red colour." The Hazel seldom exceeds 20 feet in height, and from its mode of growth and size may be called either a small tree or a large shrub. The South of Spain produces great quantities of Hazel nuts, which are exported in considerable numbers to other parts of the Continent, particularly from the port of Barcelona, by which name all the Spanish Nuts are known. The Hazel appears to have been looked upon by the ancients more in reference to the superstitious practices in which it was employed than on account of its useful properties. Pliny states that torches were made of its branches at marriages, the burning of which was supposed to be lucky to the young couple. In more recent times advantage has been taken of the credulity of mankind by its employment for the purpose of discovering metals, water, hidden treasure, lost property, &c., by means of a divining rod formed of a twig of Hazel. The impositions that have been practised by designing persons by the aid of this instrument are almost incredible, and it has scarcely as yet fallen entirely into disuse.

#### HORNBEAM.

The Hornbeam is raised to the amount of from 5000 to 6000 plants a year. It is not nearly so much in request as the two previous subjects. It is raised from seed obtained in Scotland; the seed being sown when ripe, or kept in dry sand till the following spring and sown in the usual manner. According to Miller, the Hornbeam reaches 70 feet in height, with a large round stem, perfectly straight and sound when growing on a stiff clay, which appears to be its natural soil. In this country it is much used for hedgerows, to afford protection and shelter in nurseries, &c., where it is kept cut back and clipped close. It is said to thrive on cold barren and exposed hills, and in situations where few other trees will vegetate. It is by no means of slow growth, and resists the violence of winds better than most other trees, from its close compact habit, and is thus well adapted as a means of shelter. It has been recommended that it "be raised from seeds planted in the spot where it is intended to grow, and these seeds may be sown in autumn, when they will germinate the following spring." In like manner with the Beech, the leaves of the Hornbeam remain on the branches till the young buds push them off in spring; it is thus a good winter as well as an effective summer shelter. The Hornbeam when in bloom is particularly elegant. *R. D.*

### New Garden Plants.

#### RESTREPIA FALKENBERGII, n. sp.\*

This new *Restrepia* is easily recognised by its strong growth, its unicoloured sheaths without blotches, its large leaves (my largest one 0.05 : 0.09 m.), which are underneath, almost totally bluish-purple, or with several stripes of that colour. The flowers are in the way of those of *Restrepia antennifera*, yellow, with some white and purple. If you do not expect flowers of a *Vanda teres* from a *Restrepia*, you may consider it a lovely gem, but *de gustibus non est disputandum*.

Who was its discoverer? I cannot say. It may have been discovered by M. Patin, in New Granada. The two flowers he kindly gave me look admirable, and the purple stripes on the side of the connate inferior sepal are more conspicuous than in my last specimens. Yet this beautiful flower has, what our French friends call "beauté de diable"—it is good for nothing, since the flowers have been smashed with a hot iron. Such flowers are very useful for preserving well the charms of colour, but a botanist detests them as soon as he has to make careful investigations. If I were a collector I might prepare a few flowers with a hot iron, to give evidence of colour, and then dry others in the ordinary way. I think hot-ironed flowers would do very well for Messrs. Stevens' sale-rooms.

My recent specimens were gathered by two fresh collectors, Messrs. Falkenberg and Schmidtchen.

\* *Restrepia Falkenbergii*, n. sp.—Cæspitosa, magna (usque 0.19 m. alta); vaginis ancipitibus sursum ampliatis ac obliquis immaculatis; folio cuneato oblongo obtuse acuto, discolori; sepalo impari a triangulo basilari in caudam longiorem apice clavatum extenso; sepalis paribus connatis apice bidentatis; tepalibus sepalis impari subæqualibus sed brevioribus et angustioribus; labello pandurato, isthmo bene angusto, portione superiori utinque obtusangulo, inferiori (anteriori) obtusangula apice obtuse bidentato; carinis obscuris ternis in parte anteriori, lateralibus ante basin optime evolutis.

The successes of Mr. Falkenberg are well known and admirable, inasmuch as this collector immediately began with successes. Usually a young collector begins by pleasing his employer or his *chargé d'affaires* with cases full of *Epidendrum cochleatum*, *E. ciliare*, *Brassia caudata*, *Eria stellata*, *Sarcochilus unguiculatus*, and such fine things, which modern Orchidists do not appreciate. Mr. Falkenberg has earned his successes not only by his knowledge, but perhaps even more by his rare skill in packing. Some authorities pretend that packing is quite indifferent, but this appears to be a great mistake.

As to Mr. Schmidtchen, from Dresden, he has just made his *début*. Mr. F. Sander has kindly sent sketches of flowers, dried specimens, some highly curious itinerary sketches and a living *Restrepia*, all evidences which speak highly in favour of the young traveller, to whom I wish good success, provided he is not yet tired of the career. This, however, is a rare case. Usually the traveller loses the peace of mind necessary for domestic life, preferring the adventurous risks of a nomadic career.

As to the *Restrepia*, it is a great satisfaction to me to name it in memory of Mr. Falkenberg. *H. G. Rehb. f.*

#### LIPARIS STRICKLANDIANA, n. sp.\*

A caespitose plant with conico-ovoid bulbs, which usually have two ligulate acute leaves, the whole being of a bright apple-green colour. A very neat sketch of the plant was kindly presented me by the possessor. The peduncle is quite two-edged, and swordlike with very sharp wings, and bears a rather dense raceme of greenish flowers, which finally may turn to ochre colour. This species comes near *Liparis stachyum*, whose dimensions it has, excepting the much shorter raceme (0.04 m. of length). Its chief features are the ensiform peduncle and the very curious lip, which is quite novel in the group, though it is superseded by the even more curious lip of that species which bears the name of its lynx-eyed discoverer, Mr. Gustave Mann. This one was sent by Sir C. W. Strickland, Hildenley, Malton, an ardent and constant friend of even botanical Orchids, whose name the curious modest plant may now bear. It was bought five to six years ago from Mr. Bull, and may be of Assamese origin. I have no doubt Mr. Bull would not be so cruel as to keep the original locality secret if one of his fellow-workmen wished especially to know the place. *H. G. Rehb. f.*

#### ODONTOGLOSSUM CRISPUM FLAVEOLUM, Rehb. f.

A fresh flower sent by Mr. R. Warner from Broomfield, Chelmsford, is totally yellow, with very few red spots and lines. Thus we have a new illustration of the nice variety introduced by Mr. Bull and Dr. Wallace. This variety is a great delight to me, since Dr. Lindley most distinctly said that his species had flowers, "yellow, with a purple-spotted centre." This statement always disturbed me, as there is not the least doubt that the typical *Odontoglossum crispum* of Dr. Lindley was a white *Alexandria*—(tip-top *Alexandria*—gathered by Hartweg. Dr. Lindley was influenced in this statement by his copy of a copy prepared by poor Matthews (who was poisoned by his sweet brown wife), and which was taken from an original drawing kept at Lima in a collection of Ruiz and Pavon. This represents an *Odontoglossum* which Dr. Lindley identified with his *crispum*, I might say with English keenness. There is a narrow-leaved (0.02 m. broad) bulb represented, with a cut and an eight-flowered (such buds and cut flowers!) peduncle. Sepals, petals, lip, are very crisp. There are two serrated keels running over half of the lip. The column has no wings. Colour yellow, with numerous small spots, as small as those I saw on the petals of *O. Andersonianum lobatum*, which I had but once, viz., from Mr. B. S. Williams. As to me, I would not dare to name it at all. After all, it is but justice to state that Dr. Lindley was a far better judge than I can be, since he appears to have seen many such copies, even from species, specimens of which were at hand (e.g., *Oncidium corynophorum*, Lindl.). Now, in such a case, a judicious observer (and who can be more judicious than Dr. Lindley was?) gets a certain instinctive appreciation of the powers of the artists he understands, whether the drawings are true, or the work of an imaginative man. Whatever may have been the original of the plant of Ruiz and Pavon, whether Dr. Lindley was right or wrong, he is now, at all events, justified by this modern English introduction. *H. G. Rehb. f.* [We learn that it was received by Mr. Warner from his collector, Mr. Carder, who collected it near Bogota. EDS.]

\* *Liparis Stricklandiana*, n. sp.—Pseudobulbis ovoideo conicis mono-triphyllis, vulgo diphyllis; foliis lineari-ligulatis acutis, pedunculo compresso utrinque alato, hinc ensiformi; racemo plurifloro; bracteis triangularibus ovaria pedicellata non æquantibus; sepalis ligulatis; tepalibus linearibus apice retusis, labello a cuneata basi transverso dilatato trilobato, lobis lateralibus rotundatis, lobo medio triangulo bivo, omnibus lobis antice minutissime denticulatis; columna curvata apice vix conspicue dilatata.—Flores nonnisi siccos compressos vidi. Sepala extus supra lineam mediam vix obtuse carinata. Calli minuti forte hemisphaerici seu conici in labello ungue videntur adesse, sed nimis compressi, humo non pro certo indicati. *H. G. Rehb. f.*

JAPANESE CONIFERS.—VIII.

(Continued from p. 213.)

*PICEA POLITA*, Carrière.\*—This is one of the handsomest, and, it may be said, happiest, of the Spruces. It is handsome in habit and outline; it is happy in the same sense that the nation that has no history is happy. Its specific identity has hardly been doubted. Its characteristics have never been confounded with those of its neighbours. In consequence the list of synonyms attaching to it is small indeed when compared with the string of *aliases* which the faithful chronicler is compelled to attach to most other subjects whose history he has to write. It has indeed been balloted about

tify all we can say in its praise. The Japanese call the plant the Tiger-tail Spruce on account of some fancied resemblance in the long pendulous branches of old trees to a tiger's tail. Its stiff very sharply pointed leaves would rather suggest the idea of tiger's claws. In any case, we would recommend the amateur to be as wary in handling this plant as he would be in caressing a cat or grasping a thistle. Rub it the wrong way and he will not forget the motto, *Nemo me impune lacessit*.

Habit.—A lofty tree, with the habit of the common Spruce, but in the young state with much of the bold aspect of *P. Pinsapo*.

Shoots.—Stout, pale brown glabrous, cushions (pulvini) oblong, the free ends very prominent,

cones growing at the ends of the branches, deflexed, elliptic, or barrel-shaped, 4—5 inches long. Scales coriaceous, shining, brown, abruptly wedge-shaped at the base, ovate or rounded and erose at the upper portion; bracts described as minute, linear-oblong, entire, much shorter than the scales (obsolete in the specimens examined); wing of seed two-thirds the length of the scale, oblong obovate erose.

This plant has been likened to the Himalayan *P. Morinda* or *Smithiana*, but its foliage is shorter and more sturdy, and the cones more barrel-shaped. The young plants in the nurseries are very different in their rigid habit and spreading or ascending branches from the more slender pendent or recurved branches of *Smithiana*. The foliage, too, is widely different

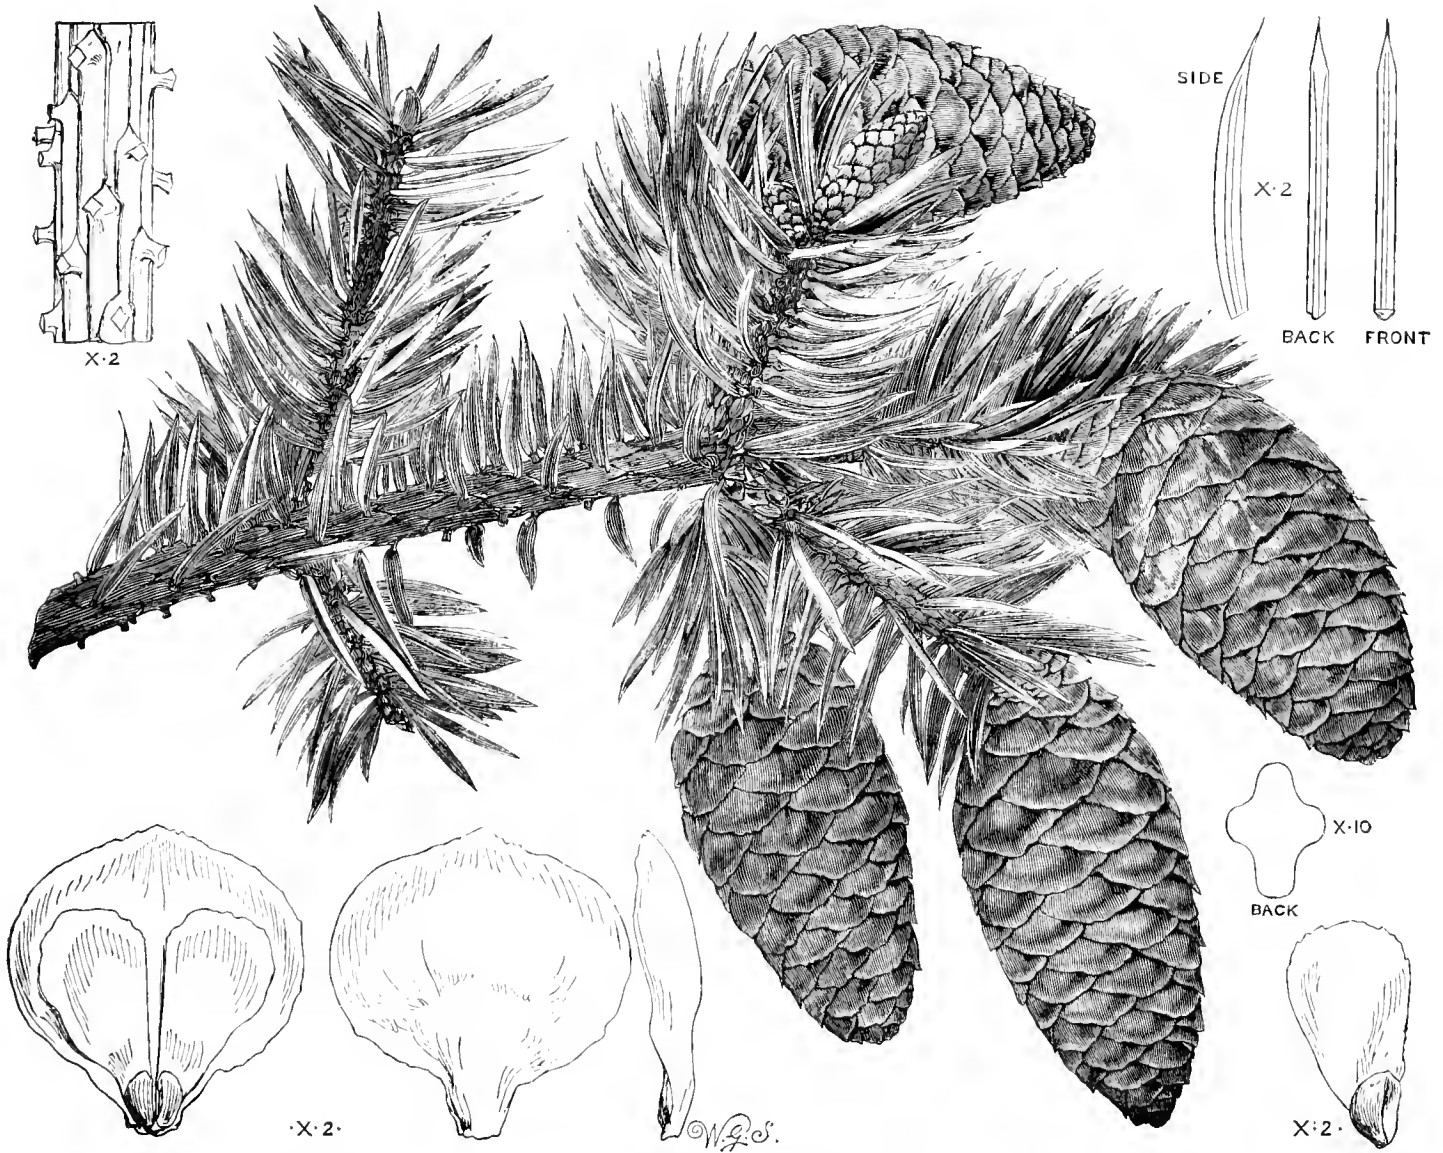

FIG. 44.—*PICEA POLITA*: BRANCH WITH CONES, REAL SIZE; PORTION OF SHOOT, SHOWING THE PULVINI, MAGN. TWICE; LEAVES, CONE-SCALES, AND SEEDS, ALL MAGN. TWICE; SECTION OF LEAF, MAGN. TEN TIMES.

between *Picea*, *Abies*, and *Pinus*, and will probably continue to be so according to the varying proclivities of botanists, but its specific rank remains unchanged. For the gardener this, the Tiger-tail Spruce, should have special attractions, for it is, at least in the young state, one of the noblest of its race, and is, we believe, quite hardy. As seen at Combe Wood and Kew its sturdy habit, bold foliage, and striking appearance jus-

those on the upper surface of the side shoots straight, on the lower surface bent to the right or to the left; cicatrices rhomboid.

Bud-scales persistent, ovate acute, shining brown when young, smoky when old and forming a tube around the base of the roots.

Leaves on the leader shoot, as on the laterals, spreading, diverging on all sides, rather distant from each other, 7—8 lines long, 1 line wide, linear curved upwards, 4-sided, with stomata on all sides, flattened at the tips into a rhomboid pungent tip. On transverse section the hypoderm cells are seen to be continuous, in a double layer at the corners. There is no palisade tissue, and the resin canals are two in number, one on either side, just beneath the hypoderm, just as in *P. Alcockiana* (see fig. 41, p. 212).

Flowers not seen.

on the two plants. In addition to the habitat in the forests of Central and Northern Japan, this Spruce is said by Siebold to grow in Korea and in the Kurile Islands, but we have seen no specimens from those localities.

Our figure was taken from a plant which produced cones at Combe Wood: the cones are rather smaller than native specimens. The seeds were originally introduced by the late Mr. John Veitch in 1862 (see *Gardeners' Chronicle* of that year, p. 1218). Carrière remarks that he has seen some very vigorous growing plants of this species produce flattish leaves (*presque planes*), on which ground he thinks it possible that it is the same as Siebold's *P. jezoensis*, an hypothesis, however, to which we cannot assent (see *ante*, p. 151). Some doubts have been expressed as to the position of the cones in this and other species,

 Hab. — Mountains of the northern parts of Nipon, where it constitutes forests. Cultivated elsewhere near the temples. (Central mountains rare, teste Mariés.) J. G. Veitch! Maximowicz!

This doubt generally arises from the fact that the botanist has often detached cones to deal with, but in the present instance there is no doubt as to the cones being bent downwards (ultimately perhaps becoming quite pendulous), as in the true Spruces. Unfortunately we can say nothing as to the value of the tree as a timber-tree, but judging from appearances only it would seem, from its sturdy habit, as if it should be valuable. *M. T. M.*

### CONCERNING FLOWER SHOWS.—II.

ONE of the principal causes of confusion at country flower shows is the presence of too many masters, and the absence of a central decisive authority. It is easy to account for this. Every member of the committee fancies himself on the exhibition day an all-important personage, and, regarding himself as a sun, wants to be the controlling centre of revolving planets. But, unfortunately, the area of ordinary shows is too limited for the comfortable existence of more than one solar system: even where there is only one, the sun finds full occupation in preventing collisions when too many comets are present on the scene. I should then lay down as a never-to-be-broken rule—I. That there should be a general manager empowered to decide absolutely on every point turning up on the exhibition day. It will be obvious that this largely endowed personage must be a good organiser, a man of decision and of even temper, thoroughly fair and honest, deeply interested in the welfare of the show, of quick perception and prompt in action. He should never under any circumstances be an exhibitor at any show under his control, or his decisions, however just, will be open to suspicions of unfairness to others, and partiality towards himself. One of the most useful men I ever knew connected with the management of provincial flower shows was also a most successful exhibitor, and he entirely marred his usefulness in the one capacity by that circumstance, and at length it became a common remark that all the arrangements were made with reference to his occupying the best position as an exhibitor, and the foremost place as a winner of prizes. This ultimately led to the breaking up of a society which was for some years the leading one of the district, and there has never since been any society of importance formed to take its place.

The general manager will of course need assistance according to the extent of the show; and the other members of the committee, if truly loyal, will gladly accept the subordinate positions of lieutenants, and fill them to the best of their ability under the directions of their chief. I should then have as Rule II., that there must be a sufficient number of competent assistants. First among these will be the secretary with his clerk or clerks; his duties should be limited to purely clerical work, which should be done efficiently and promptly: thus he will keep pace with the judges' awards, and have the prize cards in their places without delay. He should occupy a position easily accessible from all parts of the exhibition, and should remain almost a fixture there so that when wanted he may be readily found. All my readers who have been present at big shows as exhibitors will recognise the importance of this regulation, for they well know what valuable time is often wasted in hunting for the secretary, when he is rambling all over the place, dragged here by one and there by another, till he is wearied to death by mere physical exertion, and his mental power is well nigh exhausted by the unceasing drains upon it. The other assistants required for the satisfactory carrying out of the show will vary in number according to the extent of the ground covered. Suppose for instance there are five exhibition tents: each of them, if of any size, should have stationed in it a lieutenant acting under the directions of the general manager, and whose decisions so far as the exhibitors are concerned should be subject to no interference except that of the chief. Each of these lieutenants should be supplied with a list of the exhibits to be staged in his tent; and a rough plan of the places assigned to them severally should be in his possession; this of course will have been prepared by or had the sanction of the chief beforehand. When possible, the exact position in the tent for every important exhibit should be plainly marked, so that on the arrival of an exhibitor no time need be wasted in finding out where he is to stage, nor the annoyance of re-staging have to be undergone after considerable labour has been expended in arranging exhibits in the wrong place. It is customary at some shows for the

secretary to have hung up in some conspicuous place, ready for instant inspection, a list of the entries and the positions where the exhibits are to be arranged set forth. Thus, suppose there are, as in the case mentioned, five tents, and they are designated respectively, A, B, C, D and E. Suppose further that there are forty classes, and that from Nos. 1 to 4 are to be placed in tent A, Nos. 5 to 14 in tent B, and so on, the list for the information of the exhibitor will tell him at once that his exhibits in class 3 must be taken to tent A, and those for classes 6, 9, and 12, are to go to tent B. The information will cost very little trouble in the preparation, and be most useful in saving time, temper, and trouble. If we follow our imaginary exhibitor to tent A, we shall see that the exact spot for his exhibits is pointed out to him at once by the gentleman in charge of the tent. With such a methodised plan, the spaces apportioned will be gradually and smoothly taken possession of, and though there will be bustle and excitement, there need be no undue amount of either.

Of course, there must be a sufficient amount of labouring strength at the disposal of each lieutenant, and here it is that most shows are very weak. For even if, with organisation and good management the work to be done is minimised, it invariably happens that the labourers are allowed to be here, there, and everywhere, like waiters at ordinary public dinners, instead of being told off to particular work, and kept at it till it is finished. This, in my opinion, is the only proper way to get the work done well, and without undue friction. So many men to tent A, so many to each of the others; there and nowhere else should they be employed until the work they have in hand is completed. Meanwhile the general manager is passing from tent to tent, catching at a glance the temper of the moment and its needs. As he detects weak places he does his best to strengthen them, he tells his lieutenant what to do, hears this discontented exhibitor's complaint and tries to mollify him, and that one's request, and grants or refuses it as seems best to his judgment under the circumstances. However free he may be from personally carrying out details—and if the show is large he ought to be quite free—he will find ample occupation. He will find too little room for the exhibits in one place, too few exhibits for the room in another, but being freed from the necessity of doing work which can be done equally well by his assistants, his mind will be at liberty to deal with circumstances as they arise, and the almost inevitable hitches and worries will be reduced to a point which will enable him to cope with them. He will thus have every reasonable chance in his favour that everything will be in orderly array for the judges at the appointed time, only supposing that the exhibitors are punctual, or fairly so; and such as are not, unless for a very sufficient reason, should be debarred from competing. As a rule it will, I think, be found necessary to give a little latitude to exhibitors from a distance, for however well their plans are laid they cannot prevent trains being late or accidents by the way. A good manager will be able to deal with cases of this sort on their merits, and if he be fair and straightforward no one will accuse him of favouritism because he makes some exceptions to the general rule. Speaking from a tolerably long experience of exhibitors I must say I have almost always found them reasonable once they had confidence in the fairness of the management. *G. E. R.*

(To be continued.)

### NOTES ON PLANTS INTRODUCED FROM CHINA AND JAPAN.

I HAVE already sent you some remarks upon Chinese and Japanese Chrysanthemums, and also upon the Moutan Pæony. There is little to add upon the large number of fine hardy plants, a list of which has appeared in your columns. I have the satisfaction, however, to state that almost all the others are better cultivated and brought to a higher state of perfection in England than in China itself, which says much for the skill of our English gardeners.

In conclusion, one or two running remarks upon the collection may be of interest. And first as regards the Azalea: every mountain and hill in the southern and central provinces of China is covered with these beautiful plants. They are like our own Heaths, and quite as abundant. By far the finest are cultivated in gardens, indeed it was only in gardens that I could find any worthy of introduction into England. *A. amœna* and *A. narcissiflora*—which, by-the-by, I have omitted in my list—are beautiful species, and I believe are more hardy than the common *A. indica*. *A. obtusa* is the most brilliant of all the reds, and seems to set itself and all things around it in a glow. Then there are some early flowered variegated kinds, such as *A. vittata* and *variegata*, which prove very useful.

And here we must not pass the pretty *Anemone japonica*, which was one of the first plants discovered by me in the North of China. It grew and flowered in great profusion on tombs of the Chinese near Shanghai in the autumn. I may also notice a hardy Palm (*Chamærops Fortunei*), which I saw in large quantities in the central districts of China, and which gave a semi-tropical appearance to the scenery. I sent some plants to the late Sir William Hooker at Kew, and requested him to forward some to His Royal Highness the Prince Consort, at Osborne, in the Isle of Wight. These, I believe, have been thriving there since that time.

The Kum-quat (*Citrus japonica*) is another plant deserving of notice (see figure in *Gardeners' Chronicle*, 1874, vol. ii., p. 337). It grows in the central provinces of China, and is much more hardy than other members of the Orange tribe with which we are acquainted. It is subject to a warm summer, and a winter nearly as cold as that of England. Mr. Bateman succeeded in growing it well in this country. He exhibited it in fruit at South Kensington, where it was much admired. Were it successfully grown with us another remarkable feature would be added to our greenhouses in the winter months.

I have but little to say of Camellias. We have done them so well in England, and have raised so many fine varieties, that I could not add many to our lists. *Camellia Cup of Beauty* and *Prince Frederick William* were good kinds which I sent home. And here let me say a word about *C. hexangularis*, or *Star Camellia*. This was one of the plants I was asked, in my instructions from the Horticultural Society, to look out for and to bring home. I did look out for it, and, as I thought, discovered it and sent it home. It was a very beautiful plant when in bloom. Its flowers were divided into six divisions, resembling a star, and very unlike any other *Camellia* with which I am acquainted; but, strange to say, when it reached England and bloomed the star-shape was gone, and it proved to be only a common kind after all. I do not think I could have made any mistake in the matter, and can only account for the circumstance by supposing the soil and hot temperature of Southern China was the cause.

Of berried plants for winter decoration I discovered some remarkable kinds: *Aucuba japonica* and its varieties are examples of these fine plants. When I set out for Japan I was aware that all the *Aucubas* which form such an ornament to our gardens, particularly to our town gardens, were female kinds, and probably had all been raised from one plant. Need I say how anxiously I looked out for the male plant; how I cut the flower-buds open with my pen-knife before they opened, and how pleased I was to find stamens inside. It was in Dr. Hall's garden at Yokohama that I made the welcome discovery. The Doctor was good enough to let me dig up his plant, and this was the first male that reached England.

*Skimmia japonica* and others of the genus are beautiful examples of evergreen shrubs which become covered with red berries during winter. They are very hardy in this country, and are now much admired. In the West London Cemetery, where I sometimes walk, I observe they are much used as ornaments on the tops and sides of the graves.

Of trees I need scarcely write. *Abies Kämpferi*, the Golden Pine of the Chinese, *Cryptomeria japonica*, *Cephalotaxus Fortunei*, *Cupressus funebris*, *Pinus Bungeana*, the Umbrella Pine, the *Retinosporas*, and many others, are now well known and justly admired.

The *Clematis lanuginosa* I ought perhaps to mention, as I think many of the fine varieties raised lately in England claim this as one of the parents.

There is only one other point to which I wish to draw attention. Many of the Chinese plants flower very early in the year. *Jasminum nudiflorum* flowers in the winter months even in England. With very little care our banks can be covered with its pretty yellow blossoms when the snow yet lies upon the ground. The double-flowered Peaches and *Prunus triloba* can easily be brought into flower in the spring without much artificial heat. What an advantage this is if we would only take the advantage of it.

But I fear I am tiring you and your readers. I could tell you of *Dielytra spectabilis*, *Spiræa palmata*, *Primula japonica*, *Forsythia viridissima*, *Viburnum plicatum* and *V. macrocephalum*, and *Weigela rosea*. But enough: we will leave the plants to speak for themselves. *Robert Fortune*. [If Mr. Fortune himself is not tired, we are quite sure our readers are not; and even the plants will be all the better if Mr. Fortune will interpret for them, and not leave them to speak for themselves. In any case, we tender hearty thanks to Mr. Fortune for his very interesting communications. Eds.]

SELECT INDEX OF PLANTS FROM 1841 TO 1878.—(Continued from p. 170.)

<p><b>LILIUM</b>—  <i>Coridon</i> (see <i>concolor</i>)  <i>croceum</i>, 1034, '71  <i>dalmaticum</i> (see <i>Martagon</i>)  <i>davuricum</i>, 1034, '71; 488, ii., '74  <i>Dexteri</i>, 903, '71 (see <i>speciosum</i>)  <i>excelsum</i> (see <i>testaceum</i>)  <i>eximium</i>, 479, '71  <i>flavum</i>, 1422, '71 (see <i>pyrenaicum</i>)  <i>formosissimum</i> (see <i>bulbiferum</i>)  <i>formosum</i> (= <i>Thunbergianum</i>)  <i>Fortunei</i>, 212, '62  <i>fulgens</i> (see <i>Thunbergianum</i>)  <i>giganteum</i>, 479, '71  <i>glabrum</i> (see <i>Martagon</i>)  <i>haematochroum</i>, 1267, '67 (see <i>Thunbergianum</i>)  <i>Hansoni</i> (= <i>avenaceum</i>)  <i>Hartwegii</i>, 1165, '71  <i>hirsutum</i> (see <i>Martagon</i>)  <i>Hookeri</i>, Baker, 201, '71  <i>Humboldtii</i>, 1165, '71; 1079, '73; 144, i., '74 (fig.); 488, ii., '74; 728, ix., '78  <i>Isabellinum</i>, 807, '43 (see <i>testaceum</i>)  <i>Jama-Juri</i> (see <i>longiflorum</i>)  <i>japonicum</i>, 709, '71; 498, ix., '78 (see <i>Wallichianum</i>)  <i>Krameri</i>, 488, ii., '74; 180, viii., '77  <i>lanceifolium</i>, Thunberg (true), 1035, '71      — Hort. (see <i>speciosum</i>)  <i>latifolium</i> (see <i>bulbiferum</i>)  <i>Leichtlinii</i>, 1142, '67; 1422, '71; 728, ix., '78  <i>linifolium</i>, 1422, '71 (see <i>tenuifolium</i>)  <i>Loddigesianum</i> (see <i>monadelphum</i>)  <i>longiflorum</i>, 479, '71; 728, ix., '78 (see <i>Wallichianum</i>)  <i>lucidum</i>, 623, x., '78  <i>maculatum</i>, 1164, '71 (see also <i>Thunbergianum</i>)  <i>maritimum</i>, 622, x., '78  <i>marmoratum</i> (see <i>bulbiferum</i>)  <i>Martagon</i>, 1164, '71; 728, ix., '78 (see <i>maculatum</i>)  <i>Maximowiczii</i>, 1306, '69; 1422, '71      — <i>tigrinum</i>, 1079, '73  <i>medeoloides</i>, 1034, '71  <i>Metzii</i>, 479, '71 (= <i>nilgherrense</i>)  <i>Michauxii</i>, 1165, '71  <i>Milleri</i> (see <i>Martagon</i>)  <i>minus</i> (see <i>canadense</i>)  <i>monadelphum</i>, 1325, '71; 1079, '73; 728, ix., '78  <i>nanum</i> (see <i>nepalense</i>)  <i>nepalense</i>, 564, '55; 709, '71  <i>nilgherrense</i>, 479, '71; 333, vi., '76 (fig.); 728, ix., '78; 778, viii., '77  <i>nilgherriicum</i>, 479, '71  <i>odorum</i> (see <i>japonicum</i>)  <i>pardalinum</i>, 773, ix., '78 (see <i>canadense</i>)  <i>Parkmanni</i> x., Moore, 493, iv., '75 (fig.)  <i>partheuion</i> (see <i>concolor</i>)  <i>parviflorum</i> (see <i>canadense</i>)  <i>parvum</i>, 1079, '73; 773, ix., '78  <i>penduliflorum</i> (see <i>canadense</i>)  <i>pendulum</i> (see <i>canadense</i>)  <i>peensylvanicum</i>, 1034, '71 (see <i>bulbiferum</i>)  <i>peregrinum</i>, 709, '71  <i>philadelphicum</i>, 1034, '71; 832, 44  <i>philippinense</i>, Baker, 1141, '73 (fig.); 488, ii., '74  <i>polyphyllum</i>, 1325, '71  <i>pomponium</i>, 1422, '71 (see <i>callosum</i>)  <i>ponticum</i>, 1325, '71  <i>pseudo-tigrinum</i>, 1267, '67; 1422, '71  <i>puberulum</i> (see <i>Humboldtii</i>)  <i>pubescens</i> (see <i>bulbiferum</i>)  <i>pulchellum</i>, 1034, '71  <i>pumilum</i>, 1422, '71 (see <i>tenuifolium</i>)  <i>punctatum</i> (see <i>speciosum</i>)  <i>pyrenaicum</i>, 1422, '71  <i>Roetzlii</i>, 1079, '73  <i>roseum</i>, 201, '71  <i>rubrum</i>, 1422, '71  <i>sanguineum</i>, 7, '47 (see <i>Thunbergianum</i>)  <i>Sayii</i> (see <i>canadense</i>)  <i>Schrymackersii</i> (see <i>speciosum</i>)  <i>sinicum</i> (see <i>concolor</i>)</p>	<p><b>LILIUM</b>—  <i>speciosum</i>, 68, '41; 903, '71; 752, x., '78; 215, i., '74 (fruits fig.) (see also <i>superbum</i>, <i>lanceifolium</i>)  <i>spectabile</i> (see <i>Catesbaei</i>)  <i>staminosum</i> (= <i>Thunbergianum</i>)  <i>superbum</i>, 832, '44; 1165, '71; 728, ix., '78  <i>Szovitzianum</i>, 1325, '71  <i>Takesima</i> (see <i>speciosum</i>)  <i>Tametano</i> (see <i>speciosum</i>)  <i>tenuifolium</i>, 1422, '71  <i>testaceum</i>, 175, 807, '43; ## THE GENERA OF PLANTS.\*

THE important work, of which we have chronicled the previous progress, has reached another noteworthy stage, in the first part of the third volume, which has just been published. It contains the whole of the Incomplete, or Monochlamydeæ, and the Gymnospermeæ (Conifers, Cycads, &c.). The first part of the first volume appeared in 1862, so that some twenty years have elapsed since the work was commenced, and the authors may be congratulated on having at length been able to complete the Dicotyledonous orders. Let us hope that they will, after no long interval, be able to do the same for the Monocotyledons, as Mr. Bentham has been for some time past actively engaged upon the Orchids. Although most of the orders contained in this part have been comparatively recently elaborated in De Candolle's *Prodromus*, there are probably as many changes in the limitation and arrangement of the genera as in any previous part. Many of the deviations from the limitations of genera adopted by various authors in the *Prodromus* are merely returns to previous definitions. The definitions of two proposed new natural orders may be reckoned amongst the most important alterations, as the establishment of a new order is nowadays a very rare occurrence. The first is the Balanopsæ, established for Baillon's genus *Balanops*, which consists of about six arboreous and shrubby species, all, apparently, endemic in New Caledonia. Baillon himself refers it to the Cupuliferæ, but the authors of the *Genera Plantarum* think it is much more closely related to the Euphorbiaceæ, from which it essentially differs in the ovules and seeds being erect from the base of the ovary, not pendulous from the apex. The second is the Leitneriæ, proposed for the genus *Leitneria* of Chapman, two shrubby species of which are known—one a native of Florida, and the other of Texas. The genus is figured in Hooker's *Icones Plantarum*, xi., t. 1044, and has hitherto been referred to the Myricaceæ. Bentham and Hooker place their new order between the Platanaceæ and the Juglandæ.

Of all the orders, however, contained in this part, the Conifereæ is perhaps the most interesting to the majority of the readers of this journal; therefore, we will briefly set forth the arrangement adopted, together with the limits of the principal genera. As in the *Prodromus* (Parlatore), the Cupressineæ, Taxodeæ, Taxeæ, Podocarpeæ, Araucariæ, and Abietineæ, are regarded as tribes of the order Conifereæ, but their disposition, and the limitation of some of the principal genera, is wholly different. Parlatore admits thirty-three genera, Bentham and Hooker thirty-two. The numbers agree so closely in consequence of Parlatore having admitted several more genera in the Cupressineæ than Hooker and Bentham, although the former author places *Cedrus*, *Larix*, *Picea*, *Abies*, *Tsuga*, &c., under *Pinus*. It is satisfactory to find that the authors of the *Genera Plantarum* have been able to leave the genera of the Conifereæ, with one important exception explained below, almost as they are understood by horticulturists. We allude more particularly to the large genera. *Callitris* includes *Frenela*, *Widdringtonia*, and some other less known names. *Diselma* is referred to *Fitzroya*. *Libocedrus* includes the recently published *Calocedrus* of Kurz, while *Thuja* (the spelling adopted), is made to include *Biota*, *Thuyopsis*, *Chamaecyparis* and *Retinospora*. This is the greatest deviation from what may be termed the ordinary nomenclature. *Wellingtonia* is definitively reduced to *Sequoia*. *Athrotaxis* (not *Arthrotaxis* as commonly written), it is stated, is closely allied to *Sequoia*, and can only be distinguished from *S. sempervirens* by the native country and the acuminate scales of the cones. *Ginkgo* is the name retained for the Maidenhair Tree, commonly known as *Salisburia*; and *Dammara* makes way for the older *Agathis*. The Abietineæ are divided into the following genera:—*Pinus*, Linn.; *Cedrus*, Loud.; *Picea*, Lindl.; *Tsuga*, Carr.; *Pseudotsuga*, Carr.; *Abies*, Juss.; and *Larix*, Willd. With regard to *Picea* and *Abies*, Don, in Loudon's *Arboretum Britannicum*, misapplied them by substituting the one for the other, and he has been wittingly or unwittingly followed by

most subsequent British writers; but the authors of the *Genera Plantarum* have returned to Link's original definition. Of course there was no help for this in following the rule of recognising the right of priority. *Piceas*, then, have persistent cone-scales, whilst the scales fall with the seeds from the cones of all species of *Abies*. On what ground the authors quote as synonyms the names knowingly proposed by "Johannes Senilis" for previously named genera does not appear. Such names should be ignored, otherwise every person desirous of notoriety may obtain it in the same manner, and have his vagaries handed down to posterity in a standard work.

Among the large orders which have undergone considerable modification, the Euphorbiaceæ and the Laurineæ are the most important, and a glance through the copious references under many of the genera will give an idea of the immense amount of labour expended upon the 450 pages of this part, especially when we know that each of these is verified in the proof sheets by direct comparison with the works quoted. The order Urticaceæ includes the tribes Ulmeæ, Celtideæ, Cannabinæ, Moreæ, Artocarpeæ, Conocephaleæ, Urticeæ, and Thelygoneæ; and the genera *Betula* and *Alnus* are regarded as forming a tribe of the Cupuliferæ.

## GARDEN GOSSIP.

BY A LADY.—NO. I.

A GRUMBLE.—Ladies of small means, with a patch of ground behind their villa residence and a taste for flowers, will understand me when I say there is nothing they dread so much as the visit of the odd-jobs man, who comes round once a week to "do up" their gardens for them; unless it is that of the man sent from the nursery gardener's once or twice a year to prune or plant. The odd-jobs man is probably ignorant, but may possibly be under control, and if he is not changed very often may learn where the pet plants are hidden underground in winter, even though the label has disappeared. But the man from the gardener's is often a fresh hand every year, and he knows nothing of the special garden, or the special tastes of its owner, and he has no interest in anything beyond the one bit of work he is sent to do. Consequently, when the lady goes round to look at the trees that he has pruned, and to clear up the fallen twigs, which he seldom cares to remove from the beds on which they have dropped, she often finds that one of her pets has fallen a victim to his carelessness; or if he has been employed to plant, perhaps some darling alpine has been cast aside as a weed to make room for a scarlet *Pelargonium*.

Two years ago I set a man who was working in our garden to lay down fresh gravel on the paths in my rock garden, especially charging him not to touch the beds and plants. On going out to look at his work, I found a root of *Aubrietia* lying in a little hollow devoted to plants requiring moisture and shade. I asked the meaning, and was told, with many apologies, that he had accidentally uprooted the *Aubrietia*; "but," he added, in a tone intended to inspire hope and confidence, "I was going to plant it again just in that spot." He had been going to put a plant of the common *Aubrietia* (a perfect weed in my garden) on the top of my Swiss yellow *Pinguicula*, and a pet Norwegian specimen of *Asplenium viride*! He seemed extremely puzzled when I objected to the arrangement, preferring to throw away the plant which he had thought so precious.

But this is but an example of the accidents that frequently attend the visit of the odd-jobs man. The man from the gardener's may generally be expected to know better, but this expectation is not always realised. Gardeners must, of course, have young hands on their establishments, and when there is a press of work they cannot always avoid sending these out to the ladies who want their gardens done up for the summer. Young hands are often conceited, and apt to fancy they must know more about gardening than any female, and so they give but slight attention to her hints and warnings. Yet it may well happen that the lady herself could do the work just as well, if not better, were it not that she lacks the physical strength she once possessed.

For I think the love of flowers and of gardening grows with advancing age and inability to garden, and the same lady who as a girl thought it a great nuisance to have to cut off the dead Roses, or weed a flower-bed, will be glad enough to do it in her old

age, and only long to be able to do more than her failing strength will admit of her attempting.

An old lady naturally cares most for old-fashioned flowers; for, after all, the greatest charm flowers possess to the old is their association with bygone days. What charm can a bed of *Pelargoniums* boast that will compare with that of a root of *Starch Hyacinth*, if the latter grew in a corner of the kitchen garden of her father's parsonage? Or what cares she for the latest sport of a Chinese *Primrose* in comparison with the double lilac *Primroses* for which she used to hunt in the shrubbery in the early spring days of her childhood? So she tries to fill her garden with flowers which, to her, are living memories of her youth, and perhaps tries in vain to get the gardener to respect plants which he regards as little better than rubbish. Many ladies will treasure for life some old-fashioned flower which is directly descended from an individual plant that belonged to a mother or sister long since departed; and the loss of a treasure of this kind, through the carelessness of a man hired for the day, is mourned almost as if it were a renewal of their original loss.

Some ladies, stronger in mind and body than the generality of their sex, try to avoid all these dangers by dispensing altogether with the gardener. I know one instance in which an elderly lady, with the assistance of her maid, does all the work of her garden, even including the mowing of her grass-plot; and the consequence is that her little garden abounds with charming old-fashioned flowers that her fond hands have protected since the days when they were commoner than at present. Her garden is bounded on one side by an old wall, from every crevice of which spring lovely little Ferns, which she assured me were self-sown. It seemed as though they knew where to find protection from their natural enemies, the Fern-hawkers, just as wild birds will come and build in any garden where nest-taking is absolutely prohibited.

But instances like these are rare; and in spite of the present agitation in favour of teaching ladies to garden, I doubt whether the professional gardener will ever suffer much from female competition. I can but advise all ladies who care for their flowers to supervise the hired gardeners whom they are obliged to employ occasionally, and never to let their gardens be put in order while they are from home.

On the other hand, I would beseech all gardeners to remember that there are some who do not care for showy beds of *Pelargoniums* and *Petunias*, but who do care very much for common and often weedy-looking plants, and that a due consideration for the tastes of their employers, and a little forbearance towards their special hobbies, would save them from being looked upon rather as enemies than as the friends, which they ought to be in virtue of mutual tastes and occupations.

## A MODERN CONSERVATORY.

THE accompanying illustration (fig. 45) represents the exterior view of a new conservatory and plant-house, erected last autumn at Eagle Cliff, Greenhithe, the residence of Mr. R. S. Dunbar, of the Thames Bank Iron Company. The conservatories illustrate Mr. W. H. Lascelles' patent system of bent wood construction as exhibited by him at the Paris Exhibition. The advantages are increased strength with improved appearance at a very slight increase in the cost; there is no movement in the bar, and in the case of a greenhouse erected a few years since in the Horticultural Gardens, when it was taken down after being there two years, there was not a broken or cracked square of glass, although it was glazed with bent glass. We may note, by the way, that the centre of the straight har roof is the weakest place; but in a curved roof all parts are equally strong, and the effect produced both inside and out is better than in the case of a straight roof. A curved roof admits more sunlight and heat than a straight roof, and Loudon, thirty or forty years ago, said that for growing plants or fruit a curved roof was much to be preferred.

The heating of the structure is supplied by six rows of pipes in a trench below the floor-line, and so arranged that either conservatory can be heated at will; while the ventilation is amply provided for by the lantern-roof, which opens by a simple mechanical contrivance on either side or both, as may be desired, while the large hanging sashes by a similar arrangement provide for free ventilation, which can be done instantly, and yet is amply secure against a gale of wind or any one attempting to open them from the outside. The conservatories have an agreeable appearance, and the fine-foliaged and other plants, as arranged by the excellent gardener, Mr. W. Green, lend a charm to the whole surroundings.

## LONDON MARKET PLANTS.

(Continued from p. 202)

**THE PLANT HOUSES.**—From what I have said at pp. 180, 202, it will be understood that the glass accommodation at Messrs. Beckwith & Sons is very extensive. There are over fifty houses, averaging about 105 feet long, and from 11 to 40 feet in width. They are constructed so as to give an amount of light to the plants which I have never before met with, and much doubt if any exist equal to them in this respect. The whole of the portion which holds the glass is composed of thin iron bars about  $1\frac{1}{2}$  inch in breadth, just strong enough to afford stability but no more; each of these bars consists of a single piece running right through from one wall-plate to the other bent to the requisite angle in three places, that is, at the ridge and each eave. There is no ridge-pole or anything of a like character, neither is there anything at the eaves in the shape of a longi-

opening upwards, one just overlapping the other when shut, in a similar way to the glass at the roof.

It will thus be seen that unless it were possible to make the roofs of plant-houses all one transparent piece, like a propagating glass, they could not have more light than Messrs. Beckwith's houses afford. They, at all events, have hit upon the way to give all the light possible to their plants, without which the soft-wooded things grown could not bear the heat they receive in winter. The glass employed is 24 oz., 20 by 18 inches. Much has been said from time to time for and against iron roofs, some maintaining that the drip from the iron injures the plants, and that the breakage of glass in them is greater than in wood. As to the first objection, it is simply imaginary unless there is neglect in painting; neither is there any foundation in the second if the glass is not put in too tight. I have seen a good deal more glass cracked in wood-roofed houses through sudden fluctuations of the weather than was to be seen in

through the autumn, winter, and spring months, are necessarily compelled to use much more artificial heat than is required in either private gardens or general nurseries. The houses here are well piped—all 4 inch: twenty-one of them, each of the same size, 130 feet long by 11 feet wide, have six rows of pipe, or 840 feet each—the wider houses proportionately more; there is in all 40,000 feet, or over  $7\frac{1}{2}$  miles.

Much has recently been said about garden boilers, and many who take an interest in the subject will no doubt feel curious to know how many, and what description of boiler is used. There are only seven, consequently they have over 1 mile and 100 yards each. I had an opportunity of seeing and examining how they did their work after dark during the severe frost last month, and can vouch that these immense lengths of piping were so hot that the hand could not be borne upon them for a moment; in fact, any one acquainted with the heating of garden structures could not fail the moment he entered the houses to notice the

FIG. 45.—CONSERVATORY AT EAGLE CLIFF, GREENHITHE. (SEE P. 236.)

tudinal piece or spout, no purlines, brackets, or cross-stays, upright or other supports, except in a few of the widest houses; nothing, in fact, inside or out, from end to end of these long houses, but the thin bars and the glass, which is bedded in putty, and puttied at the top as well, all as close and tight-fitting as can be. The sides consist of a single upright square of glass which meets the lowermost square in the roof, the bottom of which just rests on the upper edge of the side square, and overlaps it slightly so as to throw off the water which is caught by the spout that, instead of being in its usual place at the eave, is fixed to the wall plate. At the ridge of the houses the arrangement is similar, the top squares at one side coming up a little higher than those at the opposite side of the roof and also slightly overlapping them; these laps at both the ridge and the eaves are, like the whole, as tight as possible. The ventilation is by shutters in the side walls, and hinged lights in the roof: the latter, about 2 feet deep, in pairs opposite each other, and instead of being hinged at the top, which, as will be understood, the arrangement of the ridge does not permit, they are hinged at the bottom,

any part of Messrs. Beckwith's establishment. All the wood used for staging is Pitch Pine, not painted, which on this resinous timber is simply useless as a preservative. The houses that have been recently built, and others that are to go up, may be said to be imperishable, for there is nothing about them that can rot excepting the doors and their frames. A description of one will suffice: 120 feet long, 16 feet wide, roof of iron and glass, like those already described, centre and side stages all of concrete, made as follows: one part hard-setting lime to five of the fine siftings from burnt clay ballast. As the walls and stages are being built of this, about two parts clinkers, old broken bricks, and any hard refuse material that happens to be at hand, is worked in, and in this way are used up and got rid of; the material soon dries, and then is all faced with a quarter of an inch of cement. The top of the side walls is hollowed out so as to carry off the water without the aid of ordinary gutters. These concrete houses have a substantial appearance, and will no doubt be durable.

I have already indicated that those who grow for market such quantities of plants that are forced all

unmistakable sensation always present where the pipes are hot. The boilers are Mr. Beckwith's invention. They are completely different from any others that have ever come into use, so far as I have been able to ascertain, and do their work most effectually with very much less fuel than any that have come under my notice. The ground occupied by Messrs. Beckwith's place is flat and somewhat low, water standing, I am told, within 3 feet of the surface, but none of the stokeholes are drained, instead of which they are made watertight. Again cement is brought into requisition, and, as managed here, it gives certain evidence of its superiority over bricks. The stokehole, including the space required for the boiler to stand, is excavated, and the whole bottom and sides are then built up in one solid piece of concrete 12 inches thick—in fact it forms a concrete tank. The concrete for this purpose is made of one part Portland cement to five of the fine-sifted ballast. The stokeholes continue as dry and impervious to water as if they were hewn out of a solid piece of granite. Messrs. Beckwith, like a good many other people, have had enough of bricklayers at 9*d.* or 10*d.* per

hour, with often very little exertion at these figures; and, despite predictions as to failure, resolved to try this description of concrete for a chimney shaft. It was made a strong erection, just upon 40 feet high, and the result is that it stands and looks as well as if built of stone. It cost, I understand, about half in labour and material what a brick chimney would have done.

The annual propagating and growing up to the standard here attained of the immense number of plants, with the preparation of such of these and the cut flowers that falls to each working day's quota for market, even with the advantages of the division of labour carried out in places of this description, nevertheless involves a vast amount of work, yet it is got through by thirty-one men and boys; but the number employed does not give an idea of the work done, for although the labour movement of the present day is so insidious as to leaven with its baneful presence almost every occupation, still it does not seem to have reached the market growers' establishments, nor is it likely to. *T. Baines.*

## Forestry.

**THINNING SCOTCH FIR PLANTATIONS.**—I regret that Mr. Michie's details at p. 15r do not affect the question at issue, although interesting enough in other respects, and I must again ask Mr. Michie why he confines his observations to unsuccessful plantations, when he must surely be able to find more encouraging examples of good forestry within the bounds of the widespread plantations in Strathspey and on Dulnan-side, as well as at Cullen?

Having been the unintentional cause of this discussion, I can only hope its continuance may attract more general attention from practical men who have it in their power to throw light upon the subject, and if anything I have said is open to objection I shall be glad to arrive at the truth, even at the expense of my own expectations. At present the question, "Do woods pay?" is still undecided.

I have given instances from authentic sources that plantations of Scotch Fir have yielded an income during fifty years' growth equal to an annual rental of from 30s. to 40s. per acre; Mr. Michie has shown that woods managed and disposed of by him do not yield more than from £30 to £40 per acre during sixty years' growth. Doubtless many practical foresters have read Mr. Michie's statements in the *Gardeners' Chronicle*, and their opinion of his system of managing and valuing his woods would be of great use. I would especially ask their attention to the results of the plantation marked No. 4, planted in 1858 with Scotch and Larch, and thinned for the first time in 1869, when eleven years old, the cost of thinning being 5s. per acre, and the farm tenants being allowed the thinnings for their trouble in taking them off the ground. Now, by Mr. Michie's showing, there remained on the ground after this thinning at eleven years old only 589 trees per acre, and unless this was caused by numerous failures one sees no reason for removing so many trees, which would not have injured, but rather done good to their neighbours if they had been allowed to remain and been thinned out gradually until the trees stood from 15 to 20 feet apart. Then again the low price Mr. Michie gets for his timber has the effect of reducing the income to a very serious extent. As an instance he sells Scotch Fir trees containing 7 cubic feet at 6d. per foot, or 3s. 6d. each, whereas in other districts there is no difficulty in getting from 10d. to 1s. 2d., and at present there is a marked improvement in the demand for timber of all kinds, as may be seen from recent sales.

Mr. Michie's example loses half its value by such miserable returns, but even more so by his admission that "he had no record of the date of the formation or planting of it, and only knew its early history from hearsay and its subsequent appearance;" and again he informs us that "the turf dykes were let down when the trees were about fifteen years old, and sheep admitted to graze among them at pleasure." In short the plantations must have been neglected during the most important stage of their growth, and could not have been expected to be much better than failures.

I have given in another publication for this month, the *Journal of Forestry*, a statement showing that after charging compound interest for fifty years at 5 per cent. on the rent of the land and on the cost of

plants and planting, the extent of land being 20 acres, there is left after the land is cleared a surplus of £1500; and if the rate of interest is reduced to 2½ per cent. this surplus is increased to upwards of £2000, being equivalent to a yearly rent for fifty years of from 30s. to 40s. per acre. There are immense breadths of waste land of various kinds spread over the British islands, and a large proportion of them suitable for growing trees, much of it being on slopes needing almost no drainage, and in many cases already enclosed with turf dykes, requiring no outlay but the cost of plants and planting. What an increase to the value of landed property would take place were such lands planted with trees. If enclosures and drains are required, the surplus I have shown will bear a large reduction for such purposes, or any other extra expenses, and still leave a very gratifying augmentation to the value of the land before it was planted.

In conclusion, we have authentic results to show that plantations of Scotch Fir on congenial soil have yielded the return I have named, and I have no doubt of their doing so again, provided they are protected from ground game, and that the periodical thinning and pruning be directed by an intelligent forester. In such a case the trees will not be allowed to injure each other before being thinned, nor will they be encouraged, by thinning too soon, to throw out strong lateral branches, which retard the yearly upward growth of the tree by depriving the main trunk of its necessary nourishment. Be it remembered, that in the case under discussion we do not want picturesque trees, but trees which will grow soonest into money, and the best suited and earliest ready for the market. *Wm. Baxter Smith, 4, Salcombe Villas, Merton.*

## Garden Operations.

### FLOWER GARDEN, ETC.

No matter how beautifully situated or how perfect all other surroundings of a garden may be, if the walks are not kept clean and hard there is—to my mind at least—the one essential to full enjoyment lacking: hence the importance of keeping these in perfect condition, and no season is better suited than the present for a general overhaul of them in the matter of repairs, as the long severe frost has discovered to us the weak places; all such should be dug out and filled in with brick rubble or clinkers, the drains generally should be cleansed, and a fresh surfacing of new gravel be given to all parts that look anywise dingy. Under trees the gravel is apt to get green and moss-grown, and in such parts a sprinkling of salt will destroy the moss and impart brightness to the gravel. The general use of salt for cleansing walks is not to be commended, for, although it kills weeds when first applied, it acts as manure afterwards, and though another application would again destroy them, a too-oft-repeated dose renders the gravel "pasty" the whole of the winter season. Prior to the final surfacing and rolling down of the walks grass verges should be cut with an edging iron, and gappy places in Box or other edgings be made good.

As to lawns turfing ought not longer to be delayed; the turf is now soft and pliable and the roller has due effect, and the more rolling lawns can have just now the finer and firmer will be the sward the whole of the summer. Lawn grass seeds may be sown at any time now; on heavy soils a month hence would be better, to admit of a quicker germination through the soil being warmer, but on light sandy soils it is always desirable to sow early that the seeds may get a firm grip of the ground before a dry time sets in. Soils of every description that are intended for laying down as lawns should previously be well consolidated by treading and rolling, and the surface be rendered smooth and friable by repeated "pointing" and raking over. Ivy on buildings or screens should now, before new growth is made, be closely clipped in, its full beauty being obtainable only by thus yearly trimming it, and the practice also hinders the lodgment of vermin by keeping the growth close to the wall. Clematis, Wistarias, and all other deciduous climbers may now be pruned and tied; any that are to be planted should have immediate attention, and the same remark will apply to Roses of every section. A few of the earliest flowering kinds may be pruned, but the general stock will be best if not pruned for another month, and by that time the full extent of injury the frost has done will be visible, and they can then be pruned accordingly.

Summer bedding-out—by way of propagation of plants—must now start in earnest. Pot off Pelargoniums that have been wintered in store pots; we have not space to pot ours singly, so shallow boxes are used, and the compost being principally leaf-soil, they transplant from these with good balls, and the

plan is in every way a success. Our standard variegated bedding kinds are the old Mangles' Variegated, May Queen, Lady Plymouth, Crystal Palace Gem, Rev. W. F. Radclyffe, Flower of Spring, and Sophia Dumaresque; of standard flowering kinds, Vesuvius, Bontire, Waltham Nosegay, Jean Sisley, Christine, Master Christine, and Lord Palmerston. New kinds have been repeatedly tried, but the above old kinds have not yet been surpassed by any. Petunias, Verbenas, Ageratums, and Tropaeolums, should be used but sparingly, as they are so soon injured by rains, but a few of each are indispensable in large vases and beds; cuttings put in now will make finer plants by May than the autumn-struck plants that have been kept for stock. Ageratum Cupid is a most desirable acquisition; it is of dense dwarf growth, free flowering, with plenty of substance in the flowers, and therefore not so easily injured by rain. Coleus and Iresine should have a moist heat of 65°, and cuttings will soon be produced in abundance. These plants give us colours that are indispensable in summer bedding, otherwise their tenderness would exclude their use; the only alternative, therefore, is to use them as sparingly as may be. We find Alternantheras much more easy of propagation and general management in regard to their preparation for bedding, and also slightly harder than Coleus, that we use these more freely than either Coleus or Iresines. They should now be given a moist heat of 70° or 75°, and as soon as cuttings can be had make up slight hotbeds with leaves and litter, on which place ordinary forcing frames, then a few inches of leaf-soil, and on this about 4 inches of finely sifted soil—light loam and leaf-soil; insert the cuttings at a distance of 2 inches apart, and they will be no further trouble beyond watering and airing till they are to be transferred to the beds. There are three kinds only that retain their effectiveness throughout the season, viz., paronychioides, amabilis latifolia, and magnifica. Pansies, Violas, Calceolarias, and Gnaphaliums, are all amenable to cold frame treatment, and if crowded in these should be thinned out at once. Pansies and Violas may be increased by division when thus transplanting them.

Seeds of subtropical plants should all now be sown: some of the best were named in a former Calendar, and to these may be added Ferdinandas, Uhdeas, Aralias, Amaranthus, variegated Maize, Perilla, Chilian Beet, &c. Any plants of this class that have wintered in a cool place, and are now starting into growth, should be encouraged by top-dressing, or else repotting: the following are a few of the plants likely to need this attention:—Australian Dracaenas, Ficus, Phormiums, Cannas, Sonchus, Palms, Yuccas, Agaves, and Caladium esculentum. *W. Wildsmith, Heckfield.*

### HARDY FRUIT GARDEN.

It is seldom the misfortune of gardeners to approach the season when fruit trees are fast developing their blossom-buds with so much arrears of work on hand as is the case generally at the present time. To repeat the causes which have led to this result would be but to remind cultivators of unpleasant circumstances of which they are already but too well aware from personal experience. Planting arrangements have been upset so frequently that it is doubtful whether many important operations will not have to stand over until next autumn unless where the work is so far advanced that it must of absolute necessity be completed. We caught the opportunity of a few hours' dry weather to do a little planting which was of a pressing nature and found it very agreeable to have a good heap of soil in proper condition for performing the work. There is no use concealing the fact, that much planting remains yet to be done, and it will be of the first importance in planting standard and other fruit trees to provide them with soil into which the roots will ramify quickly and which also has the virtue of assisting root-growth to develop freely and rapidly in order that the trees may not come to a sudden standstill by-and-by when Nature has expended the supplies with which she provided herself at the end of last autumn. There has been a constant drag upon these supplies, particularly where trees have been lifted for some time; and if they can be got to work at the root before the sun attains much more strength, the better it will be for future prospects. Violent winds are now prevalent, and strong stakes will need to be put firmly to each tree as it is planted. Procrastination is a bad doctrine to initiate in this respect; let the work be done at once, and let the roots be made safe by a warm mulching of litter into which cold or frost will not penetrate to any depth, and which will be open enough for the sun's rays to act upon the soil whenever this Divine blessing is bestowed upon us. There are other perhaps less important operations which will also require both skill and tact in working out projected alterations. Raspberries, Gooseberries, Black and other Currants, which from exhaustion of the soil or other causes it was contemplated to remove to fresh quarters, had better be done piecemeal as a security against the partial loss of crops which, although common, are notwithstanding

amongst our most indispensable requisites for various purposes of cooking. The work need not be abandoned altogether, but fresh plantations may be made, and enough of the old retained in their present positions to secure a supply of fruit for the present season. Having already referred in former Calendars to the necessity of pushing forward all kinds of pruning and nailing which can be executed in moderate weather, the burning question of the hour will soon be present with us, viz., the protection of fruit blossom. I have either practised or read of every invention that the human brain can devise as a panacea for this bugbear, which appears annually as regularly as the swallows, and is soundly threshed by half-a-dozen or more stalwart gardeners with fir boughs, bracken, fishing-nets, tiffany, and a whole host of other devices, which are all of them excellent in their way, but falling far short of producing the desired effect. There is no doubt about it, that practical gardeners are alive to their present position and do their best; but it is sheer nonsense for us to fold our arms and blame the dispensations of Providence for a state of things which we as a body do not meet with firmness, nor do we even state with decision and clearness the true remedy for averting this annual disaster. That each succeeding season is growing worse than its predecessor is an undisputed fact. Meteorological statistics, if they are worth anything, prove this, and modern fashion seems to swallow up in hothouses a large proportion of what in times past was expended upon walls. Look at garden walls all over the country for proof of this. They are many of them defaced, which causes damp to lurk in every crevice, and when this moisture becomes congealed is it any wonder that blossoms, which are already feeble enough through being produced from immature growth, should be chilled to inaction, if not to death? In future let us discuss the utility of having our fruit growing areas of the tender class more circumscribed and covered with glass, of glass copings, of better kept walls, and of selection rather than collection of fruit trees. These are the cardinal points in hardy fruit culture for gardeners to discuss more frequently than they seem disposed to do, and sooner or later the question will have to assume a practical shape, however reluctantly gardeners and their employers may approach it. *W. Hinds, Canford Manor.*

#### FRUIT HOUSES.

**FIGS.**—The fruit on early started pot trees will now be approaching the most critical stage in Fig culture, and on this account great vigilance must be observed in the management of the roots. If the latter have taken possession of the new compost some means should be devised for insuring the passage of liberal supplies of manure-water to every part of the ball. The most simple and effectual way is to place bands of lead some 4 inches deep round the insides of the rims of the pots, for the reception of a little fresh mulching and water in sufficient quantity to penetrate the ball. Syringe twice a day when the weather is fine, taking care to wet every part of the wood and foliage, otherwise red-spider, after so much hard frost, will be sure to gain a footing, and prevention is always better than cure. On dull cold days a thorough damping of the surface of the bed and walls may be substituted for the afternoon syringing, as the foliage should be moderately dry before nightfall. Stop all side shoots and thin out useless spray where the trees have attained their full size, but allow the terminal shoots to grow on if the space will admit of extension without producing too much shade or overcrowding. If the roots have not found their way into the plunging material the latter may be turned and receive a few fresh leaves to keep the bottom-heat up to 75° or 80°, but when they once find their way through the sides of the pots disturbance must be guarded against as they will form one of the best safeguards to the fruit. Now we have mild gleamy weather a gradual increase in the mean temperature may be indulged in, but the gain should be derived from solar heat in preference to any great advance through the night. The above rules will also apply to succession-houses, in which the trees will now be making good growth. If trained on the long shoot or extension principle the young shoots should not be tied in too close, as Figs, when growing in light favourable situations, always enjoy a little freedom, and invariably set an abundance of second-crop fruit on short-jointed growths which are allowed to approach the glass before they are tied down. See that the inside borders are well mulched and watered, and encourage surface roots by keeping the top-dressing constantly moist. Syringe twice a day, and allow the temperature to range from 58° by night to 75° by day from fire-heat, and 80° to 85° after closing on bright afternoons. The pruning and cleansing in the latest house should now be finished, and advantage should, after the end of this month, be taken of bright days for closing early with sun-heat. In the pruning of these late houses, from which only one crop of Figs can be obtained, a little extra thinning will admit of an even spread of foliage without over-

crowding or retarding the ripening of the fruit, and the young growths will be firm, short-jointed, and, under judicious management, properly matured before the end of autumn. *W. Coleman, Eastnor.*

#### CUCUMBERS.

A long continuance of severe frost, with an almost total absence of sunshine, has been succeeded by a spell of wet and windy weather, with a minimum of sunshine, which, although we had hoped that any change in the elements must necessarily have been a favourable one, is little, if any, improvement from a forcing point of view, upon that with which we have just dissolved partnership, let us hope, for eight or nine months hence. Under these circumstances, and in order to maintain a good steady supply of fruit, great care and forethought must be exercised in attending to the special requirements and general treatment of the plants. Keep the evaporating-pans filled with liquid manure, the ammonia of which is beneficial to the plants, and detrimental to insect life. By way of neutralising any superabundance of moisture that may arise in dung frames, make a dusting of new lime and dry soot over the surface of the bed, which will probably be the means of preventing the plants from "damping off." *H. W. Ward.*

#### MELONS.

Those plants which received a suitable shift at the end of last month will now be ready for planting, if not already done, on the ridge in the Melon-house proper for trellis training. See that the plants are sufficiently moist at the roots before turning them out of the pots. The soil should be pressed firmly around each plant while being planted, taking care that the base of the plants is kept a little higher than the surface of the mound, in order to prevent the soil lying close round the collar from becoming too damp, which would cause canker in the stems of the plants. Fasten the sticks to which the plants are trained to the first wire of the trellis for support. Water in any shape must be applied with great caution during the present dull weather. Our earliest planting, which was made at the end of January in a hot-water pit upon a bed of Oak and Chestnut leaves, has not yet required any water at the roots. The plants have, however, been damped overhead on bright days (which, alas! have been few and far between), and shut up early in the afternoon with a temperature of 85°, running up to 90°. Whilst on the subject of watering I may remark, for the information of beginners, that the withholding or application of water to the Melon, as to other plants, must be determined by a variety of circumstances, the most essential being the means by which the bottom-heat is obtained—whether by hot-water pipes or by fermenting material. If by the former and more modern principle of supplying bottom-heat the plants, as a matter of course, require being watered at the roots frequently, even though the weather be dull and wet; whereas by the latter mode—fermenting material—they require no water during such weather, and comparatively little in the midst of summer, inasmuch as the bed of dung and leaves, or leaves only, as the case may be, upon which the plants are growing supplies the roots with a moist genial heat, and into this they can push *ad libitum*. On the other hand, where hot-water pipes are employed for this purpose, the circumstances are quite the reverse. Hence the advisability of exercising mature judgment—common reasoning—in the application or withholding of water, as the case may be, to the roots of Melons and Cucumbers. The above subterranean items, in connection with the vigour of the plants and condition of the weather, as also the stage of growth at which the plants have arrived, are the points by which to be guided in this important particular. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

**STOVES.**—Although we are now nearing the end of the second month in the year, a time when we expect to feel much of the sun's influence, that luminary is still hidden behind the clouds, and till these pass from before it, so as to afford a clear light and allow it to render some assistance by diffusing its rays, it is useless attempting to push forward the growth of plants by raising the temperatures in these structures, as any response made to an increase of heat under a dull leaden sky must be but feeble and enforced, whereas by waiting for the sun to aid, conditions are more natural, and the shoots they emit under such favourable circumstances will always be found to possess much greater strength and substance. Not only is it very important to keep the temperatures moderately low when there is an absence of light, but it is equally so that the atmospheric moisture should be regulated accordingly, as a lower degree of heat when accompanied by an excess of damp is very injurious. This being the case, syringing at such times should be suspended, and the paths and other surfaces only well sprinkled, from which wetting the air will take up quite as much as is good for the

plants, especially if there happens to be any tan or other fermenting material in use in the house. Where means exist for applying anything of this latter kind it is always advisable to do so, as the steam arising from such a body is very congenial to the foliage of most things, and helps materially to keep down insects, most of which are only becoming too rife at this season, and more particularly mealy-bug, a pest that breeds at a great rate. To keep these under requires the strictest attention and a continual watching, as it is only by the closest vigilance when they once get into a house that plants can be preserved from their attacks, for, unlike thrips, spider, or anything else, they are not assailable by ordinary means, and, phoenix-like, seem to rise out of their ashes. For all this, however, it is well to burn the stakes and ties that have been used near them and replace with fresh ones, giving the plants a thorough cleansing at the same time, and removing carefully the surface-soil, that all may be free from any stragglers or their eggs. Roof climbers or any that may be grown in pots will now require seeing to, as all are on the move, and the useful *Bougainvillea speciosa* is just in that forward condition as to be seriously affected by greenfly, which at the particular stage the inflorescence is now in, get down amongst it in such a way as to cripple it and also disfigure it with their excreta, without being observed. To make matters safe it is always best to fumigate a few times before the plants get much advanced, and to follow the same up with a heavy syringing, taking care when doing so not to bruise or injure the tender leaf bracts that will soon push fully out in all their branches. To prevent these from falling off it is necessary to water with some amount of judgment, as a sudden access of wet at the roots so early often produces this effect, as does also an overdose of smoke, and more particularly is this the case if an inferior kind of tobacco-paper is used. *B. glabra*, being altogether different in habit from the species above-named, which flowers on the wood of the previous year, should now be thinned out and spurred in, that there may be sufficient room for the young shoots when they form, and if the plants are in pots the aim in pruning must be to provide a good frame, by leaving the branches best situate so that when tied in position the specimens may be well and regularly furnished throughout. The same remarks apply to *Allamandas* and *Clerodendron Balfourianum*, the whole of which, as soon as they are fairly started, should be shaken out and repotted in a mixture of good fibry loam and peat, using most of the former for the *Bougainvilleas* and *Allamandas*, which delight in a more holding and heavier soil. In training the young shoots of *Dipladenias* it will be found that they do far the best run up strings strained near the glass, in which position they get much more light and air, and consequently make a shorter-jointed growth, which by-and-by it will be an easy matter to transfer to the trellis intended to receive it, when it can be evenly distributed over the surface. In potting, a work that needs taking in hand at once, it is essential to the welfare of the roots of the plants that the soil in which they are to be put should be in proper condition—a state it may be brought into by being kept under cover in a warm dry shed where it can be spread out, chopped up, mixed and prepared to suit the requirements of the several kinds to be treated, which can then be passed through hand rapidly and returned to their quarters without any delay. When dealing with the more choice species, the soil used for them should have a good portion of the earthy matter beaten out, and plenty of sharp sand added, which will keep it in a sweet, porous condition for a long time to come. In the event of bright sunshine, plants that have been overhauled and disturbed by repotting will require shade, and it will be well therefore as far as possible to arrange them at one end, that their wants in this respect may be attended to without detriment to the others, as the majority for the present will be benefited by the solar rays, which help to build up and consolidate the tissues. *J. Sheppard.*

**WATERING PLANTS.**—The necessity for giving water to plants at a temperature not lower than the atmosphere of the house in which they are grown, is a maxim generally held up as requisite one to follow. It is so-and in principle, yet it is not in all cases necessary to follow it so exactly as is often urged, particularly when plants are making little growth. Where tanks or cisterns exist inside the houses, as when provision is made for catching, warming, and storing the roof-water the needful conditions in this matter will be present; but when, during protracted severe weather, water from such sources fails, and the supply has to be drawn from pumps and outside wells or cisterns, its temperature, frequently only slightly above freezing, will have a greater disparity to that of the roots of the plants to which it is given than there ought to be, and under such circumstances enough for the following day's supply at least should always be placed inside the houses the evening previous.

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Feb 23	Sale of 5020 Lilium auratum and various other Hardy Bulbs, at Stevens' Rooms. Clearance Sale of Nursery Stock, at Ware's Nursery, Tottenham, by Protheroe & Morris.
TUESDAY,	Feb 24	
WEDNESDAY,	Feb 25	Sale of Roses, Fruit Trees, Camellias, and Azaleas, at 38, Gracechurch Street, by Protheroe & Morris.
THURSDAY,	Feb 26	Sale of Nursery Stock, at Cattell's Nursery, Westerham, Kent, by Protheroe & Morris (two days).
SATURDAY,	Feb 28	Sale of Hardy Plants and Bulbs, at Stevens' Rooms.
		Sale of Established and Imported Orchids, at Stevens' Rooms.
		Sale of Hardy Plants and Bulbs, at Stevens' Rooms.

WE regret to find that the PROHIBITION with regard to the INTRODUCTION OF LIVING PLANTS into the colony of the CAPE OF GOOD HOPE, to which we referred last week, has really been enacted. The subjoined copy of the official notice suffices to show that the authorities at the Cape have no greater share of wisdom than their brethren in Italy and Spain:—

"Colony of the Cape of Good Hope.—Government Notice.  
"January 29, 1880.

"On and after this date, and until further notice, the introduction into the colony of the Cape of Good Hope of Grape Vines or cuttings, or portions of Vines, plants, tubers, roots, bulbs, or portions thereof, is prohibited.

"By order of the Colonial Secretary, Cape Town.

"WILLIAM C. BURNET,

"Cape Government Emigration Agent.

"10, Bloomfield Street, London, E.C."

It is needless for us to point out the absurdity of this prohibition, except in the case of Vines. Any effort to convince the authorities of its absurdity would, however, probably be as futile as the prohibition itself will be to exclude the Phylloxera. The introduction of Vines or even of living plants of any kind from infected districts, might reasonably enough be forbidden, but to exclude Potatos or Dutch bulbs, or Eucalypti, or any other of the hundreds of useful or ornamental plants other than Vines is worse than stupid—it is to inflict a wholly uncalled for injury on the commercial interests and general welfare of the colony. The Vine-louse is not known to be injurious to any plant except the Vine. Other species there are which attack the Oak, &c., but these are quite distinct from the Vine-louse. No other plants but the Vines have suffered in the infected districts in France, Switzerland, and Italy. All attempts to make the insects live on the roots of other plants have failed. With reference to our own vineries, we have had during the last few years as good, and probably much more numerous opportunities of observing the Phylloxera than have fallen to the lot of most people in this country; and in no single instance have we seen or heard of the Phylloxera attacking any plant other than the Vine, and this in spite of the continual traffic going on between one house and another. A man treading on a Vine border where the plants are affected with Phylloxera might very probably convey on his boots, on his hands, or on his tools the eggs or the perfect insect from house to house, and thus infect other vineries. This, for aught we know, may have happened—it is indeed very likely to have occurred; but if the Phylloxera were, as it might of course be, introduced in the same manner into the stove or the Orchid-houses, no apprehension of any evil consequences need be entertained. The Cape Government, before enacting such a regulation, should have made enquiries as to the effect of the corresponding prohibition in Italy, and have ascertained whether the diligence of the Custom-house officers on the frontiers has been suc-

cessful in preventing the entrance of the insect. Perhaps terrified by the edicts in question the insects have dropped their wings, and ceased to lay eggs; if so, how is it that, in spite of these enactments, the insect has made its appearance in the countries named? In any case, we do not think even a Phylloxera could fly the whole length of the Atlantic, a circumstance which may afford some comfort to the Cape authorities.

It should be noted that the enactment in question refers to the "Colony of the Cape of Good Hope" only. Whether the Governments of Natal and the Transvaal have adopted similar precautions or not we have at present no means of knowing.

THE experience of the last two seasons in the culture of HARDY FRUITS, especially Apples, the most generally useful of all kinds, which have been a greater failure than perhaps was ever before known in any two consecutive summers, will not have been without its use if those who give their attention to raising new varieties will profit by it. We frequently hear it said regarding this, as other hardy fruits, that there are a great deal too many sorts in cultivation—a statement which experience proves is quite correct. The fact that some of the great trade growers profess to have over a thousand varieties is at once suggestive that, so far as regards a great many of them, they simply differ in name, without being distinct in any other appreciable manner. Yet out of this maze of varieties, even in the last most unpropitious season, there are a few, but a few only, that have succeeded fairly in almost all parts of the kingdom. Such being the case, does it not indicate that the course hitherto followed by raisers, not alone of this but of other fruits, has been in the wrong direction? No doubt the greater portion of our Apples are simply what may be termed accidental seedlings; that is, the result of seeds sown that have been fertilised in the natural way, and not by careful crossing as practised in recent years by those who carry on this work with something like a system. But even with the raisers who have produced new kinds as a result of judicious crossing different varieties possessing merit, has the selection of the sorts to breed from been judicious? So far as the properties go in both dessert and culinary kinds, is there likely to be much more achieved in anything excepting an ability to bear freely in bad seasons like the two last have been? This we think is doubtful, and venture to suggest that the efforts of raisers would be most useful if the course followed were in the direction of bearing capabilities, and such as would be able to succeed in the worst summers our island is subject to. To accomplish this, the most likely plan would be to cross a few of the hardiest kinds that are often held in little estimation, with the best, but more tender varieties. In short, we want dessert Apples of the quality of the Ribston, Cox's Orange Pippin, and Margil, with the hardy never-failing constitution of Keswick Codlin and good keeping culinary kinds that can be depended on for bearing freely in adverse seasons. We have no doubt, if this ideal cannot be fully realised, it may be much nearer approached to than is now the case. There is plenty of room in this line, not only for the raisers of new Apples, but other hardy fruits likewise.

— THE PINE-APPLE.—The Nanas, or Pine-apple, grows in the Straits of Malacca and Sumatra in great profusion with the most ordinary culture. Some think it inferior to those produced in hothouses in England, but this opinion may be influenced by the smallness of their price, which does not exceed 2*d.* or 3*d.* With equal attention it is probable they might be rendered much superior, and their variety is considerable. The

natives eat them with salt. They are liable to make the mouth sore if the "eyes" are not carefully extracted. Another kind, known in the Straits of Malacca as the Mauritius Pine, is more rare and far superior to the former. Pine-apples evidently do not require much earth round their roots in their native habitat, for Mr. SIBBALD had one growing on the top of the roof of his Attap-leaf bungalow in Province Wellesley. It grew from a refuse portion which had accidentally been thrown there, and in process of time a very fine Pine appeared, as shown in fig. 46.

— A SPRING SHOW OF FLOWERS AT CHISWICK.—It would seem as if something of the old glory that once surrounded Chiswick might again return after a lapse of many years; for it has been arranged to hold a spring show of flowers, &c., in the Vestry Hall, Turnham Green (close to the entrance to the Royal Horticultural Society's Gardens), on or about April 29. Mr. FRANCIS A. DANCER has taken an active part in promoting the show, assisted by Mr. A. F. BARRON, Mr. MAY, of Chiswick House Gardens; Mr. J. ROBERTS, Gunnersbury Park Gardens, and others. The proceeds are to be given to the West London Hospital, a valuable institution much in need of assistance. A preliminary circular, which has been sent to some of the leading inhabitants, sets forth that "it is somewhat remarkable that, whilst flower shows and exhibitions have been established in almost every parish throughout the length and breadth of the land, Chiswick, the home of the Royal Horticultural Society, the founder and originator of all such meetings, has had no flower show of its own, being in this respect far behind Acton, Ealing, Richmond, and neighbouring parishes, which have each their horticultural society and their flower shows, such exhibitions forming the most fashionable and enjoyable réunions of the season." There is every prospect that a most successful exhibition will be held about the time above-named. A subscription and guarantee fund has been started, and is receiving good support. A schedule of prizes is in course of preparation, and will shortly be issued.

— THE EXPEDITION TO SOCOTRA.—Intelligence of the arrival of Professor BAYLEY BALFOUR at Aden on January 24, has reached Kew. In compliance with instructions from the Admiralty, Captain HERON, of H.M.S. *Seagull*, arranged to convey Professor BALFOUR to Socotra, and the latter hoped to start on February 1 or 2.

— LUMINOUS FUNGI FROM THE ANDAMAN ISLANDS.—Little comparatively is known of the vegetation of the Andaman Islands. We hope soon to have a rich collection of fungi from its woods, which are described as of great beauty. We have just received the first-fruit in the shape of an extremely luminous Agaric, of a small size, but exceeding in brilliancy anything which has hitherto been observed. The cause of the luminosity is at present, we believe, quite unknown. Even the opportunities of examining the large Olive-tree Agaric of the South of Europe have been without result. The only instances of luminosity which have occurred at home have been confined to mycelia, in conjunction with decaying wood or fermenting leaves; but in the numerous cases which have occurred in tropical climates there has been no question as to decomposition. In that before us the specimens are quite young, and scarcely fully developed. We shall probably hear more about them. At present we purpose merely to give the name and characters of the species, which is certainly new to science:—*Agaricus (Pleurotus) Emerici*, n. s.—Pileus at first spatulate, quite smooth, dark brown; at length suborbicular, soon changing to white, with a slight tinge of yellow; minutely virgate; stem obsolete; gills of the same colour as the pileus, narrow interstices smooth. Pileus about  $\frac{1}{2}$  inch across, attached behind without any stem, either nearly flat or helmet-shaped, emitting a most brilliant light, the entire substance being luminous. The species was found by Major EMERIC S. BERKELEY, who is now located at Port Blair. *M. 7. B.*

— CARTHAGENA BARK.—News has been received at Kew of the safe arrival at Darjeeling of the four plants of Carthagenia Bark, with which Mr. ADOLF BIERMANN left the Royal gardens on October 29. The plant taken out to Jamaica, in charge of Mr. MORRIS, has also safely reached its destination.

— GILBERT'S CABBAGE BROCCOLI.—It will be remembered that at the December meeting of the Royal Horticultural Society in 1878 Mr. GILBERT exhibited specimens of a new Cabbage Broccoli, to which the Fruit Committee awarded a First-class Certificate, and which gave abundant promise of becoming a most valuable winter vegetable. We are glad to be able to state that at Burghley it has passed through the late severe weather without the slightest injury, and indeed at the end of January was, with the exception of Brussels Sprouts, the only thing alive

the counterpart of the malicious individual who, because the worthy Alderman was unable to agree with him on the subject of vaccination, entered at night like a thief, and showed his poor spite by destroying his neighbour's Vines. Spite thus expressed is happily not of frequent occurrence, and therefore when so shown it calls for special comment. It is now ten years since a scoundrel wishing to vent his malice against a respectable, but to him offending neighbour, entered into his orchard in the dead of night, and with a sharp instrument cut down several

a vacant season, so as to give full liberty for the carrying out of operations that require attention at a particular time. There is much to be done in a garden that needs no special time for its completion, but which can best be carried out through the winter, when there is most leisure. Few things contribute more to the pleasure derivable from the inspection of a collection of plants, large or small, than their being legibly labelled, so that those who see and take an interest in them, but who are not possessed of the technical capacity to know everything at sight, can satisfy

FIG. 46.—A PINE-APPLE AT HOME. (SEE P. 240.)

in the way of greens. A sample received at that time proved on being cooked to be mild, tender, and delicious in flavour. The heads received were of nice size, very solid, and resembling in appearance a small Cocoa-nut Cabbage. Mr. GILBERT is to be congratulated on the possession of such a sterling acquisition.

— SPITE IN THE VINERY.—The recent outrage committed upon the Vines growing in Alderman Cox's vinery, at Brighton, shows that we have amongst us some people who are capable of vile acts and of whom we have little cause to be proud. It would be difficult to find amongst Afghans or Zulus

dozens of fine fruit trees. Losses from other causes far heavier than this might be endured with equanimity, because in these are seen only causes beyond control and which evince no enmity. It is to be desired, in the interests of justice, that the miscreant may be discovered and receive a degree of punishment that shall suffice to deter others from following so cowardly an example.

— LABELLING PLANTS.—Success in gardening does not depend upon a given amount of labour being bestowed on the different subjects taken in hand, so much as it does on everything being done in due time, and above all upon getting all forward when there is

themselves as to the name of any individual plant without inquiring. This is a matter that should receive attention in every garden each winter. Labels with numbers upon them should never be tolerated in a private establishment; they may answer the purpose so far as those connected with the cultivation are concerned, but beyond this they are useless.

— A YELLOW MARGUERITE.—Lately there have been several enquiries as to a yellow flowered Composite, very like, except in colour, the Pyrethrum or Chrysanthemum frutescens, of which the French are so fond, and not without reason. In a recent number of the *Revue Horticole* we find it stated that

is that the smooth woody H.P.'s of the Jacqueminot race are more lasting than the spiny ones. This may be contrasted with Mr. MAWLEY's statement that the thorny and vigorous varieties resisted the prolonged cold far better than the smooth-wooded varieties. The whole paper is very suggestive and valuable, and is one that should not be dismissed with the scant notice we can at present give it. The meteorological papers of Mr. MAWLEY constitute, as they did last year, perhaps the most intrinsically valuable portions of the *Rosarian's Year-Book*, and afford evidence that the literature of the Rose need not, as it often does, consist of frothy nothings. The Buddhist's idea shows evidence also of that contemplation which is characteristic of Buddha.

— **ABIES OR PICEA.**—In some recent articles we have adopted the Continental usage of calling the Spruce Firs Piceas, and the Silver Firs Abies. This procedure has exposed us to some little criticism, on the ground that such changes are very embarrassing. It may be well, therefore, to state the grounds for our use of the terms in the above manner, as it is contrary to that adopted in most English garden catalogues. Our reasons are:—1. That the practice we have adopted is the correct one; 2. That it is the one which we were aware was to be followed in the volume of the *Genera Plantarum* of Mr. BENTHAM and Sir JOSEPH HOOKER, as referred to in another column—a work which is likely to remain as the standard authority on questions of identification and nomenclature for some years to come; 3. That it is the one generally followed on the Continent; and now that intercourse is so frequent, and foreign books are consulted by students as often as English ones, it is desirable to secure uniformity wherever possible or desirable. These, then, are the reasons which have weighed with us. It is not necessary for us to state the grounds on which our opinion rests; they may be found in the work above cited, and indeed in most works devoted to Conifers.

— **INDEX NUMBERS.**—We are requested by the publisher to recommend those of our readers who are desirous of preserving the numbers containing the Select Index of Plants from 1841 to the end of 1878, now in course of publication, to make early application for the numbers in question. The great cost and labour involved in the production of this index render it improbable that it will be reprinted.

— **STEALING GRAPES.**—On Monday, Feb. 9, at the County Police Court, Tamworth, a respectably dressed young man, named HARRY KENNETH, an under gardener in the employ of Sir ROBERT PEEL, M.P., was brought up in custody charged with stealing thirty bunches of Grapes from the vineries at Drayton Manor, on the 31st ult. The prisoner, who entreated the Bench to be lenient with him, and not to send him to prison, said he did not know how many bunches he took. Mr. OWEN THOMAS, head gardener at Drayton Manor, said on going into the vineries he missed about thirty bunches of Grapes. He asked four of the gardeners, as well as the prisoner, where the Grapes had gone to, and they all denied any knowledge of them. Further inquiries showed, however, that prisoner had borrowed a large box from one of the servants at the Manor, packed the Grapes in it, and sent them away by rail. He (Mr. THOMAS) was prepared to prove that prisoner had sent two other lots of Grapes away as well. The market price of the Grapes, which were of first-class quality, was 4s. 6d. per pound, and the thirty bunches would weigh about 50 lb.—Prisoner said he was very sorry for what he had done. The case was dealt with under the Summary Jurisdiction Act, and the Bench ordered the prisoner to pay £5 fine, £10 the amount of damage, and the costs.

— **THE FROST AND THE PLANTS.**—It is full early to take stock of our losses at present; but, on the whole, we think the injury done is likely to be considerably less than in 1860-61. Nor have we in this country suffered to the same extent as in Belgium and Northern and Central France, where the slaughter among Roses, Araucarias, Cedars, Hollies, Yews, and other plants, has amounted in many cases to extermination.

— **CEDRUS DEODARA SHEDDING ITS LEAVES.**—There are instances where specimens of this fine Conifer, standing alone and in exposed positions,

show signs of having been hard hit during the recent severe frosts. They are shedding their leaves to such an extent that the soil beneath the trees looks as if covered with a deep covering of new mown short grass. The tops of some of the trees and the upper branches are almost denuded of foliage, and have a very bare look against the sky. It will be some time before the fullest evidence is forthcoming of the injury done to vegetation during the prevalence of the sharp frosts of December, 1879, and January of the present year.

— **WEST GLAMORGAN AGRICULTURAL ASSOCIATION.**—Mr. BERNARD DYER, F.C.S., of 17, Great Tower Street, London, has been appointed Analytical and Consulting Chemist to the West Glamorgan Agricultural Association.

— **BRISTOL CHRYSANTHEMUM AND SPRING SHOW SOCIETY.**—The tenth spring exhibition will be held in the Victoria Rooms, Clifton, on March 17 and 18.

— **LEE AND BLACKHEATH HORTICULTURAL SOCIETY.**—The dates fixed for holding this Society's exhibitions are Wednesday and Thursday, June 23 and 24, and November 24 and 25.

— **THE BOROUGH OF HACKNEY CHRYSANTHEMUM SOCIETY** has decided to hold its next annual exhibition on Thursday and Friday, November 18 and 19.

— **READING HORTICULTURAL SOCIETY.**—The spring exhibition of this Society is fixed for May 20, and the autumn show for August 19.

— **EALING, ACTON, AND HANWELL HORTICULTURAL SOCIETY.**—Easter Monday, March 29, is the date selected for holding the spring exhibition of this Society. The summer show is to be held in the grounds of Manor House, Ealing, on July 7, and an autumn show will also be held on November 17.

— **PUBLICATIONS RECEIVED.**—*Reports of the Tenant Farmers' Delegates on the Dominion of Canada as a Field for Settlement.—Permanent Pastures; their Formation and Improvement.* By Mr. MARTIN H. SUTTON, of Reading. (12th ed. HAMILTON, ADAMS & Co.)—*Delectus seminum, &c., St. Petersburg Botanic Garden, 1879.*—*Bulletin de la Société Botanique de France.*—*The Apricot: its History, Varieties, Cultivation, and Disease.* By D. T. FISH. (Bazaar Office, 170, Strand).—*Chelsea Window Gardening: or Some Notes on the Management of Pot Plants and Town Gardens.* By L. M. FORSTER (R. BENTLEY & SON).—*California and Colonisation.* By J. P. WHITNEY (J. B. ADAMS, 57, King William Street, E.C.).—*The Diabetic Reformer.—Our Water Supply: a Discussion for and against the Fitness of Thames and River Water for Domestic Use* (W. TROUNCE, 10, Gough Square, E.C.).

— **THE WEATHER.**—General remarks on the weather during the week ending February 16, issued by the Meteorological Office, London:—The weather was very changeable and unsettled over the whole country. On the 10th, 11th, and 13th the sky was moderately clear in most places, but on all other days the weather was dull, squally, and very rainy generally. The temperature was slightly above the mean value in "England, S." and "England, N.E.," below it over Ireland, and about the mean for the time of year in all other districts. Several slight frosts were experienced during night-time at the central, eastern, and northern stations. The wind was southerly (S.E. to S.W.) generally in nearly all places; over the S.E. of England, however, easterly to north-easterly breezes were reported at the commencement of the period. In force the wind was generally strong in the S.W., W., and N., and very frequently blew a strong gale, while on our eastern coasts it was moderate to fresh until the 16th; a strong gale then blew over all parts of the kingdom. The rainfall was less than the mean in "England, N.W." and over Scotland, but more in all other districts. In "Ireland, S.," the "Midland Counties," and "England, S." the excess was rather large.

— **GARDENING APPOINTMENTS.**—Mr. JAMES BEALE, late Gardener to ROBERT SMITH, Esq., of Golding, Hertford, has been appointed Gardener to H. J. BARRETT, Esq., of Langford Park, near Maldon, Essex.

## FROM IRELAND TO BIARRITZ.

I LEFT "the bonnie blythe blink o' my ain fire-side" and Paddyland on February 9, in search of better climes, though indeed as to weather we in Ireland have had very much the advantage of our neighbours across the herring-pond. Our greatest frost during the winter was 18' (this in Co. Meath); we had hard on two months without rain to speak of. The 5th was lovely, a day that showed spring ready to write "her alphabet upon the sod in many-coloured flowers." Aconite and Snowdrops were up in hundreds, but I looked in vain for *Dondia Epipactis*, and only a *Crocus* here and there showed green. The sombre sky and drizzly rain of Monday made it easier to tear myself away from the prospective beauty of my spring garden. Only *Myosotis* seemed touched. *Aubrietia*, *Iberis*, *Arabis*, alpine *Auriculas*, *Daisies*, *Erica carnea rubra* (by far the most showy spring bedding Heath I ever saw), *Santolina*, and "*Sedums* in variety," as the catalogues say, looked as snug as possible. So did the Pansies: the Duchess of Edinburgh even graciously showed herself, her head a little bent, either in shyness at being alone in her glory, or in respect upon the elements. There was no Sunrise, though I have generally noticed these two Pansies in bloom together. *Azalea mollis*, *Malus floribunda*, some *Spiraeas*, and other early flowering shrubs were in fullest bud, but for some I saw "Oh much I fear some ill unlucky thing." Everything flowered so late with us—*Clematis Jackmanni*, for instance, not till near September—and Roses went on until they could not be called "of summer." The frost came when the sap was high, and I fear many a gardener will walk this season amongst the graves of his flowers, like the representation in the last "Le don Quichotte"—I know not French politics enough to say to whom it refers, but truly a knight of a sorrowful countenance, wandering amongst the tombs of all good things. London was enveloped in fog, Paris perishingly cold, and even at Bordeaux sensation did not tell that we were in the sunny South.

I was struck with the cultivated look of the country between Paris and Bordeaux, every inch seemed made the most of, but it was a landscape in sepia, and I think, had I asked the hackneyed question, "Do you see any green in my eye?" I would not have been indignantly, or reproachfully, but anxiously wishful for an affirmative. I noticed as we steamed along the constant use, often in quite humble cottage gardens, of bell-glasses or cloches, stronger and of a different make from any I ever saw in England; and I considered how useful they would be for the preservation of Parsley and other vegetable luxuries now that we seem to be in for Siberian winters. Most men near Bordeaux, when they sit in their porches, rest under their own Vine, and the queer gnarled stems thrown protectingly about would be admired even if imagination did not picture them as they will be—covered with leaves and great purple Grapes. We passed some grand Magnolia trees and big tufts of Pampas-grass, the sight of which last caused me to break the Tenth Commandment, for the cruel cold of the winter before last killed all mine down. *Arundo Donax* weathered it. On for a long bit after Bordeaux the country is sandy and covered with Pine woods, each tree tapped for its resin—a proceeding, I should think, highly destructive, but which does not matter, as they are mere sticks. Station-masters in these parts seem to fancy *Forsythia viridissima*: I counted splendid plants of it at three separate places in glorious flower. This was one of the things over which I shook my head forebodingly in my last walk round a Meath garden. The leaves, which should have fallen, were hanging brown and withered-looking upon the bushes, but, indeed, alas! this symptom is not uncommon this year amongst my deciduous shrubs.

A bright blue sky was over us when we reached Biarritz, and that warm sunshine greeted us which gladdens the hearts of all things living. We had to unpeel as we preceded the omnibus from the little station, and on a hedgerow bank I picked the first wild Violet 1880 had sent me.

"Yes, the sun is hot," said my companion, English to the backbone; "but the Violets should be coming up at home." Perhaps: but home could not give us the hot sun or the soft balmy breeze that yet, with a touch of tonic in it, blew upon our faces. The weather here is simply delicious, and it is delightful to sit upon the sands and watch the big waves break themselves

up upon the rocks in huge mountains of spray. There are sea-birds here, which sit upon the water, twelve of them often together, motionless, as if dead, allowing themselves to sway with the swell of the sea, but diving energetically, after the fashion of a tufted duck, when a big wave comes. I think I can make out through my field-glass a white patch each side of the head, otherwise they are entirely black. Their duckings under are most highly amusing to watch.

I have not made out the fashionable resort of the English here—certainly not the beach, which we have to ourselves, bar Spanish children, who ask for Cabbage and are satisfied with cash—"Donnez moi petit chou," is their cry—and packs of lean, hungry, starved, "belong-to-nobody" looking dogs, all of them curs of the very lowest degree. When the feeling of *dolce far niente* shall have worn away I mean to make expeditions after the flowers I am assured we shall find in our walks *partout*, and then you shall hear again from A.

## GARDENERS' ROYAL BENEVOLENT INSTITUTION.

REPORT OF THE COMMITTEE FOR THE YEAR 1879.—Your committee have again the pleasure and gratification in presenting their report. During the past year nine pensioners have died, one leaving a widow, who, in accordance with the rules (having produced the necessary certificates, to the satisfaction of your committee), succeeded to a pension of £12. In the same period, seven pensioners have been added, and a further addition of nine will be made this day. The pensioners added in January last were all placed on the list without election, they or their husbands having been subscribers to the institution for over fifteen years. This was in strict accordance with the rules.

On this occasion the nine pensioners who will be added have (or their husbands) been subscribers, and they also will be placed on the list without any trouble or election; and this course your committee have reason to know meets with the support and approval of a large number of the subscribers, more particularly those who cannot, by any possibility, be recipients of the charity.

These additions ought to bring home to the minds of gardeners the advantages of the Institution, and the assistance they could receive (in the event of their being subscribers) in their declining years, should want and distress overtake them, as among the number of applicants are several who have been constant and warm supporters of the Institution, occupied good positions (one was many years a member of the committee), and never imagined that they would ever require the aid of the Institution. These facts speak for themselves, and require no comment.

In obedience to the unanimous resolution of the last general meeting, empowering the committee "to take such steps as they might consider necessary to bring the Society and its benefits more immediately before the gardening world and the public generally," your committee instructed the Secretary to proceed to the provinces, and interest, if possible, the large and influential nurserymen and seedsmen in its behalf, by becoming stewards for the anniversary dinner, and by their issuing an appeal to their friends and connections.

The thirty-sixth anniversary dinner took place, as usual, in the summer, under the most disadvantageous circumstances, on which occasion Mr. Serjeant Cox occupied the chair, with his usual ability; it was, however, very numerously attended by many representatives of the large nursery and seed firms, the leading horticulturists and the public; and the result, taking into consideration all the circumstances, was a grand success, as in this last year of gloom, great depression, distress in trade, and bad weather, when most other societies of a similar nature have suffered very materially in their annual income, and in many cases have had to trench upon their reserve funds, this Society, thanks to the exertions and influence of the stewards, has not only increased the amount of its reserve fund by £300, making the total amount £12,000 in the Three per Cent. Consols—thus placing the Institution on a firm and secure basis, and having a sure guarantee that all its engagements can be met—but it has been enabled to increase its payments to the pensioners to £1043 13s. 4d., the largest amount ever yet paid in one year. Great efforts were made by the stewards and your committee to increase the annual subscriptions; and although, on the last occasion, your committee congratulated the subscribers upon receiving the largest amount ever recorded, viz., £802; this year the annual subscriptions have been increased to £878. For the eminent services rendered to the Society by the stewards the committee beg to tender them their warm and sincere thanks.

Your committee regret to announce the loss of several of their kind and liberal benefactors; among them may be named the Baron Lionel de Rothschild, William

Wilson Saunders, Esq., and Mr. Serjeant Cox. Their places will not easily be supplied.

Your committee beg to announce a legacy of £15 from an old gardener, the late Mr. William Lennett, of Norwood. This they consider most pleasing, coming, as it does, from one for whose benefit the Society was instituted.

In conclusion, the committee earnestly hope that the members will continue to use their influence among their friends, and will not relax in their exertions to make the year 1880 more successful than the year now passed away.

The number of pensioners is as follows:—36 men, at £16 per annum; 36 women, at £12 per annum—total, 72: to be increased to 81.

EDWD. R. CUTLER, Secretary.

## Home Correspondence.

**Bedding Out.**—It was with great pleasure that I read your leader in the *Gardeners' Chronicle* (p. 176) on the important subject of the bedding-out of summer flowers, as latterly a great many hard things have been said about both it and its patrons. It required considerable courage on your part to give a distinct note clear and ringing above the dismal howling there has been of late in treating of the subject in question. All gardeners, to say nothing of their employers, have been treated as though they were in an advanced state of lunacy, and ought to be forthwith confined with as much despatch as possible, and all for what? Just because they did as all true gardeners should, and as all real lovers of Nature do—strove to the utmost to bring the effects of fields of colour where it was possible their employers should be able to enjoy them in the quietude of their own homes. What is more enjoyable than to walk amongst multitudes of flowers bright with colour heightened by massing and contrast, and all looking so well cared for, and growing so happily in unison—no straggling, every plant seeming to just fill its allotted space, and where all else seems perfect; then comes in addition a waft of delicious fragrance—the fragrance of sweet, pure, bright flowers, which is eagerly breathed in the refreshing coolness of early morning or in the balmy softness of evening during summer. However beautiful herbaceous and alpine flowers may be, they cannot be used to give the effects of beds of colour near a mansion and under the windows, where alone flowers can be enjoyed from under the balcony or from the inside shade of the boudoir during the fierce heat of a summer's day. Any alpine or herbaceous plant which can be made, by no matter how much trouble on the part of the gardener, to carry a constant bloom or which possesses a constant and distinct leafage or a stately or graceful habit, is eagerly sought after and used to give variety. No lady or gentleman or true gardener would ever cut down, or even wish to cut down or destroy, a stately tree, such as a Cedar of Lebanon, to make room for a few fleeting summer flowers; and no true lover of Nature would do away with our Snowdrops, Aconites, Crocuses, Violets, Daffodils, Daisies, Buttercups, and Bluebells, and all the host of treasures which Nature has placed in such bountiful profusion in our English woods and meadows and hedgerows, which are the delight for all ages of children, and in the gathering of which

they receive never-forgotten pleasure. I do not envy those whose childhood and youth have been passed in large towns, and who consequently cannot in this way enjoy their childhood over again, as those can do who are happy enough to have been brought up in or about our noble English mansions or secluded country villages, where all, rich and poor, equally enjoy gathering flowers from Nature's bounteous store. *W. Denning.*

**Broccoli.**—It would be interesting to know how Broccoli generally has stood the severe weather. I have given six varieties a trial, and will briefly state the results. Out of a bed of 250 plants of Veitch's Self-protecting I did not cut one, they are all killed down to the ground. Snow's Winter White came off a little better, I have about seventy plants out of a bed of 250. Osborn's Winter White has stood the best, only about thirty plants being killed out of a bed of 250. Sutton's Improved White Sprouting has stood very well, I have only about sixty plants out of a bed of 250 killed. Of Sutton's Reading Giant I have 160 plants alive out of 280 planted. Sutton's Protecting has stood very fairly; I have about 110 out of a bed of 250 plants. I should like to hear the experience of others, which may be of benefit to us the next winter. Our soil is a stiff cold clay. *H. S. James, The Gardens, Fairleigh Castle, Bath.*

**Roses.**—Out of over 2000 Roses I have only seen two dead plants—ground plants. I pity Brier standard Rose growers: no doubt they have lost considerably. If Roses are grown on Briars they should be ground plants or seedling Briars, which, as far as I can judge from the few I have got, are beyond all praise. Manetti stocked Roses are best for dry ground, and Brier stocked Roses for moist ground. It is curious but true that in severe winters the old Rose wood dies, but the new twigs resist the frosts. In 1860-1861 I pointed this out to Mr. Henry Taylor, of Fencote, Bedale, Yorkshire, and he wrote back saying that "sap was a non-conductor both of heat and cold." He is the raiser of Taylor's Yorkshire Hybrid Potato. As regards Rose stocks and Rose lands, Roses have likes and dislikes, and experience must find out what they like and dislike. In my opinion Mr. Prince deserves the thanks of Rosedom for introducing Roses on the seedling Brier. Almost all mine are on the Manetti stock, with which I am still delighted. *W. F. Radclyffe, Feb. 14.*

**Odontoglossum Londesboroughianum.**—When I had the pleasure of visiting the beautiful collection of Orchids belonging to H. J. Buchan, Esq., Southampton, in November last, a plant of this species was flowering in perfection; and to my agreeable surprise, when I called again on February 12 the same spike was still existing with a quantity of its rich golden flowers quite fresh. Mr. Buchan informed me that the spike had been in flower ever since October, and had produced no less than forty flowers. This speaks well for the lasting qualities of this grand Odontoglossum, which is worthy a place in the most select collections. There are very many other varieties in flower here, amongst which are fine varieties of *Odontoglossum Alexandræ*, *Masdevallia*, and *Miltonia*. These are all in grand condition, reflecting great credit on Mr. Osborne, under whose charge they are grown. *Alfred Outram.*

**Galanthus Elwesii.**—In the autumn I bought a dozen bulbs of this Snowdrop, and planted them in the coldest part of my garden within 9 feet of a north wall which is 10 feet high. Yesterday (February 13) at 3 P.M. the sun had not reached them, so they were still ice-bound. In spite of these unfavourable circumstances, the buds are fully developed, and have been so for a week or more, and seem to be only waiting for the sun to reach them to fully expand the blossoms. The buds are fine, and very pure in colour. I fancy they are whiter than any other Snowdrop. *Nivalis plicatus*, and *Imperati*, in situations where they get the full benefit of the sun, are but just above the soil; and close to these is a bulb of *Elwesii* I bought in 1878, which is equally behind. Does drying off the bulbs induce early blooming? I trust that many of your correspondents who take an interest in hardy bulbs will make notes of any peculiarities they may discover this season in their Snowdrops, and then give your readers the advantage of them. *Jae Aye.*

**The Tree Pæony.**—I was much interested in reading Mr. Robert Fortune's article on the Tree Pæony in the *Gardeners' Chronicle* of February 7. There used to be an old specimen in the kitchen garden at Newton Don in Berwickshire, one of the coldest localities in the South of Scotland. From what I knew of this particular specimen I have always been under the impression that the Tree Pæony was hardy. There are a few plants here. One close to the house is protected throughout the winter, as Lord Haddington has doubts as to its hardiness. Two

plants I lifted three years ago from an out-of-the-way border and planted in the kitchen garden have never had any protection, and are now pushing fresh growths. These two plants grew so vigorously that last spring I cut them back. Other plants in shrubberies make little progress. The whole of the plants have one feature in common, and that is, that the points of the shoots die back a few inches every year. Mr. Fortune appears to be of the opinion that there is only one species of the herbaceous *Pæony* which can be made use of for grafting the Tree *Pæony* on. Is that opinion correct? It would be interesting to know that any one of the varieties of the herbaceous *Pæony* in cultivation would do as a stock. *R. P. Brotherston, Tynningham, N.E.*

**Daphne Blagayana.**—This pretty hardy evergreen shrub, which was described by Freyer in the *Flora* for 1838, is a native of the Carniolan and Styrian Alps, where it blossoms about the month of May. It was found in 1837 by Count Blagay, to whom it is dedicated, on Mount Lorenzberg, near Biellichgrätz in Carniola, and it has been also gathered on Mount Goestingberg, near Gratz, in Styria. It is said to grow, in company with *Erica carnea*, in calcareous soil; and from its dwarf spreading habit will doubtless be a suitable plant for an artificial outdoor rockery. Though somewhat spare of foliage as hitherto seen in the cultivated state, its little heads of creamy white flowers seated within a circle of leaves

FIG. 47.—DAPHNE BLAGAYANA.

terminating each branch, give it a distinct and very pleasing character, and its powerful fragrance will make it specially welcome as a garden plant. We first met with it at the quinquennial show held at Ghent in April, 1878, where it was exhibited by M. Van Houtte, at a time when it was scarcely if at all known in this country, at least in the cultivated state. It then attracted considerable notice as a sweet-scented hardy evergreen, of small stature, and when shown on the 10th inst., at South Kensington, by Messrs. Veitch & Sons, of Chelsea, it was very rightfully awarded a First-class Certificate. The aspect of the plant, leaving the flowers out of view, bears some resemblance to that of young plants of *D. Laureola*, and the stems are described as being often simple, and scarcely a span high. Messrs. Veitch's examples formed neat little spreading bushes with several branches, which were bare of foliage at the base, but furnished at the ends with a tuft of sessile, leathery leaves, in the centre of which the flower-heads were nestled. The leaves are sparse, obovate, or oblong-lanceolate, attenuated at the base, plane, and as well as the branches glabrous. The heads contain numerous flowers accompanied by silky bracts; the flowers are slightly hairy, the four lobes ovate-oblong obtuse, a couple of lines in length, creamy-white, and they are succeeded by fleshy, white, semi-transparent berries. The heads of flowers are described as being as large as a Walnut. This new form of a very interesting and popular genus, while not for a moment comparable in merit with such fine species as *D. sinensis (indica)* or *D. odora*, is not without value in its own particular way. It may be said of this, that it is neat in habit, hardy in consti-

tution, an early bloomer, and evidently capable of being accelerated by heat, its pretty little floral tufts being well adapted for bouquets, and possessing an aromatic sweetness which may be regarded as one of its crowning merits. Altogether the plant may be considered as an acquisition amongst dwarf hardy evergreen, sweet-scented, early-blooming shrubs. *T. M.*

**The Clean and Sooty Kettle.**—It is a curious but instructive fact, that most housewives favour the opinion held by Mr. Challis, which gives the preference to a soot-begrimed kettle over a new or clean one to obtain a quick boil. This is either based on a fallacy, or it has a practical substratum of fact to support it. Is it not the case that an iron utensil coated with soot is more readily absorbent [retentive?] of heat than is one free from this incrustation, and if it be so the result which the housewife asserts is explained. Naturally no one would favour an incrustation of outrageous thickness, but this does not exist on any pot or kettle that is now and then brushed over, as all tidy housewives should serve them. With boilers, where a tremendous fire is playing about their surfaces, a thick coating of soot is almost impossible, and such incrustation as may be found will exist in all kinds of boilers that are subject to fire and smoke, but that it presents any obstacle to the free heating of the boiler is most improbable. What destruction of the metal goes on proceeds much less from the action

of the fire than from the effect produced by the alkalis and other mineral ingredients found in the water, and which gradually eat away the inner surface of the boiler. No well tended iron pot or kettle ever suffers one tithe from fire that it does from the action of water, unless the utensil is carelessly left exposed to the action of the fire in an empty condition. As showing how little the fire really affects the outer surface of a kettle, it may be quoted as a well known fact, that a kettle filled with water in a boiling condition may be lifted from the fire and stood on the open hand without producing pain. I have now on the fire near which I am writing an iron kettle, holding about 3 quarts, which has been in constant use in my household for more than twenty-five years. The steam, most probably, has somewhat damaged the point of its spout, and from time to time has corroded the rim of the lid, so as to render a new one necessary; but scrape the sooty incrustation on its sides, and it is found there as perfect as ever, and yet I am sure so constantly has this kettle been used, that it has been employed to boil water upwards of 18,000 times, and yet it is a long way to be preferred to a new one. *A. D.*

— I hope the answer Mr. Challis has obtained from the Editors about boiling his kettle will be satisfactory to him, and that by taking the soot off he will now be able to get an earlier breakfast, for we have it on undisputable authority that it will boil quicker if freed from its sooty deposit. As to the information he gives for my "special consideration" with reference to coke being a comparatively expensive fuel for either tubular or other forms of boiler, I should say that much depends on the dis-

trict one happens to be placed in, for if near the pit's mouth no doubt coal is the cheapest, but anywhere else the cost will be much in favour of coke, which, as I said, gives out a fierce heat and does not foul the flues, and must therefore be far preferable to fuel, that does. *J. S.*

**Newspapers as Protectors.**—During this severe winter the early Potatoes under glass here have been effectually saved by spreading sheets of newspapers over them. Others have lost all their crops who did not do this, and we are thus warranted in trusting to these means on frosty nights. These papers are easily laid on; they do not weigh so much as to hurt; they are easy to remove (at times); and are cleanly protectors. Indeed, there is no reason why a double tier, with say a foot interval between the upper and lower tiers, should not be sufficient to save many tender flowers also. The papers could be laid on twine, or wire, so as to include enough air-space to double their effect. I also use them in the fruit-room, and over choice seed Potatoes, with equal success. Half-a-crown's worth of newspapers can be made to save many times their value of plants or flowers—the more so as they last very long. *Thos. C. Bréhaut.*

**Manure Heaps.**—Throughout any market garden district there is no commoner object than a huge heap of stable manure, reeking with steam and emitting a malodorous perfume. The owners, unable to comprehend the enormous waste that is going on, pride themselves that the manure is being nicely rotted, and that presently it will come out short and solid. But what is lost in the interim? As the process of putrefaction goes on, accompanied as it is by fermentation, the most nutritive properties of the manure are eliminated, and in time it is found that the solid remains are manure in name, but have lost nearly all their properties. Wherever a strong perfume is emitted, there it may be assumed is a waste going on of the very ammonia which forms the most valuable feature of the manure. In a majority of cases not only has the fermentation eliminated all the nutritive properties, but also all the juices; so that when in time it is carted on to the land it is little better than old thatch. If manure be applied to the soil when fresh the soil gets all its benefits, but in the system mentioned above the air gets that which the land so sadly needs. *A. D.*

**A Seedling Cactus.**—In the summer of last year I was much surprised with one of a batch of Cactus seedlings that flowered with me along with many others, and which produced one bloom only; but that was a striped one, like a Carnation. Whether it will be a permanency will have to be proved by again flowering it. I have never heard of such before in the Cactus tribe, but I do not know what others may have seen or heard of. I have some very beautiful ones in the darker shades and tints, and very grand flowers. I have a great many more yet to flower, so I may expect something peculiar, as they were fertilised with pollen of some of the dwarfier kinds, and I think the seed parent was *C. Greenii*, or *cœrulea grandiflora*, one of the most beautiful of the Cacti. In pinks, *Phyllocactus speciosus elegans* and *speciosus grandiflorus*, and *Edwardsii*, are the best as yet; but there are others very nice and distinct. The *Phyllocactus* are very fine and beautiful flowers, of rich shading and tinting. *J. S. C.*

**Rose Stock Pruner.**—Allow me to say, in answer to "S. B.," that he does not appear to have quite caught the idea I endeavoured to sketch. Our pruners measure, handles and all, just 22 inches long, and I find that in practice the operator usually grasps the handle about half-way up, and so his objection about the length of handle necessary for lever power falls to nought; and further, the power of this primitive machine, as he calls it, is limited altogether to the capacity of the blades to hold, and any stock too large for them is considered useless, and consigned to the wood-heap. The method of harnessing is done in this way: It should be assumed that all the pressure is downwards, and this is overcome by the bench the instrument rests on; there is a slight but continuous lateral motion, and the object of the straps is to overcome that—therefore we securely fasten the leather straps to the bench in such a way that each one forms a loop, and these two loops form a sort of socket into which one of the handles of the instrument is thrust; it is then ready for work. The point your correspondent has failed altogether to see is this—that so soon as the work is finished the handle of the instrument can be withdrawn, and it at once becomes the portable and adaptable tool I claim it to be; in fact, the long-handled scissors, the essential part of the machine, are only so while Rose stocks are about; whereas the arrangement of blades, wheels, and a handle, as figured, considerably longer than that of my instrument apart from its bench, is useless, and when the Rose stock season has passed must be put

away to rust (this is what usually happens to such things) until the season returns. One word more, and this the result of my own practice: a skilful man can with my machine manipulate the stocks as rapidly as a second person can hand them to him. *T. Smith.*

**Brussels Sprouts.**—The finest growing Brussels Sprouts I have ever seen have been in the autumn for the past three years at Heckfield, where Mr. Wildsmith has invariably had a patch in grand condition—stems from 30 to 36 inches in height, wonderfully stout, and covered from top to bottom with splendid Sprouts. These have resulted from sowing in rows where they are to remain, thus avoiding transplanting, and that is no doubt a most important matter in relation to this valuable vegetable. The best time to sow is when the weather is open, towards the end of February, in very shallow drills, the soil being well pressed down, and if birds are troublesome the rows may be protected with a few lengths of cotton. From 2½ to 3 feet is the customary width between the rows, the soil being previously trenched and well manured. Of course there are many plants to be thinned out, and these can be utilised in other quarters, where they may serve to produce a quantity of smaller Sprouts for later consumption. *A. D.*

**Uprooting of Conifers.**—Mr. Culverwell's advice and practice, p. 182, in surface-dressing large Conifers as a means of adding vigour and stability, all must admit to be sound and good, and, as Mr. Rust has it at p. 215, hits the right nail on the head; but I much doubt if Mr. Rust himself has made as good a hit in advising Conifers to be planted high (above ground level I take it), simply for the sake of being able to surface-dress them so as to enable them to better resist the force of the storm. Unless the situation is low and wet I would never plant Conifers or any surface-rooting trees above the natural ground level, as in hot dry summers they are apt to suffer much in their young state for want of moisture. Mr. Culverwell, like Mr. Frost and many others who pride themselves in the noble specimens they have taken such pains in cultivating, prepared the soil thoroughly by deep trenching, &c., before planting; and on ground thus prepared Conifers will not usually require surface-dressing until they have attained a good size, say fifteen or twenty years' growth. I think Mr. Rust is far off the mark in predicting death to trees of this age, by a reasonable amount, say 1 or 2 feet, of soil being placed close round the collar or stem of the tree; and I venture to suggest that there must have been some other cause for the death of the Sycamore or Beech tree he describes as having died the same summer after being so treated. I only wish it was possible to kill a large deciduous tree by simply mounding soil around its trunk—the doom of one that is darkening my window would soon be sealed. Some years ago I had much of this tree-surfacing to do in levelling a large tract of lawn containing Beech, Sycamore, Oaks, and Scotch Firs. One of these trees had as much as 4 feet of soil firmly raised round its trunk, extending a considerable distance beyond its roots, and the remaining nine or ten trees had from 1 to 3 feet of soil thus added. I watched these trees very closely for several years after, and I fully believe the addition of soil did good to them, at any rate their foliage was green and vigorous during a hot dry summer that soon followed, whilst most of the trees around them suffered much in their foliage for want of moisture at the root. *Thos. Kestley, Darley Abbey, Derby.*

—Mr. Rust has done well in sounding a warning note as to soiling up the stems of Conifers and other trees, many of which are frequently injured thereby; but as to surface-dressing, the benefit from that is considerable, for when judiciously applied it encourages the top roots to spread, and by the extra weight it affords helps to steady the trees and keep them in an erect position. The beauty of all Conifers is much advanced by planting them on raised mounds, which, though small at first, may be added to as growth proceeds, and if not made too circular or formal the undulations thus afforded to lawns or pleasure grounds add greatly to their appearance, while if level or unbroken they have a tame look like a flat meadow, that the eye runs over without seeing any lines to admire. Not only do trees look much better, and the ground more natural, when laid in a wavy form, but the trees grow much faster from having a richer soil to feed on, as when planted high they are comparatively independent of the poor stuff below, which they only penetrate for the sake of an increase of moisture and a more secure anchorage, to enable them to hold their own against storms when they come. *J. S.*

**Peach Twigs and Galvanised Wire.**—I notice that in the report of the meeting of the Royal Horticultural Society, Mr. Hudson, of Gunnersbury House, Acton, sent some shoots of Peach trees that had, according to the statement in the *Gardeners' Chronicle*, apparently been injured by galvanised

wire, and it would be interesting, therefore, as well as profitable to many to know whether the trees from which the shoots were taken are indoors or out [Indoors], for, if outdoors, the injuries are much more likely owing to the late summer and winter, which between them have settled the fate of many Peaches and Nectarines. It is impossible to look over trees of these anywhere without seeing the deplorable consequences of the frost on the unripe wood, which I fear will be more apparent later on than now. We have a good deal of our wall surface covered with galvanised wire, and, as I have stated frequently before, I have never seen any ill effects from it at any time of the year, neither can I trace any now; and so convinced are we of its great utility in preserving the bricks, and of its harmless nature, that we are at the present moment putting up more. Our experience of it is not of short duration, as we have had it in use both in and out for Peach training for many years, and I have never seen a cankered shoot except where bruised by pressure under tight tying. This is a matter easily avoided, and if trellises are made as ours are, summer tying may be done away with, as twigs of Privet answer all the purposes of training, and with them it does not take a quarter of the time to put the shoots of a tree in their place. *J. S.*

**Orchid Culture** (see p. 213).—Having had experience in growing Orchids at home, and in collecting them abroad, and having been a passive agent in the use of cocoa fibre and leaves in their cultivation, I have come to the conclusion that such advice as given by the writer referred to should, like doctors' physic, be well shaken before taken. In lofty or large houses required to be kept warm, cocoa fibre may be used with advantage in severe weather if put down near the heating medium, and if kept moist it gives off a genial moisture, which counterbalances the drying heat of the pipes during the night, but if kept wet enough to prevent its becoming a harbour for woodlice it soon becomes black and unsightly. If doing no good, it at least is doing no harm. With regard to decaying leaves, every one connected with the profession knows the genial heat and moisture they give off, and I am an advocate for their use in any structure where they can be employed with safety, but in an Orchid-house it is simply putting in a nursery and refuge for many insects injurious to the plants, and any beneficial result arising from their use would be, in my opinion, more than balanced by the ravages of the shoal of slugs and other pests. I have still a lively recollection of hours spent at all times of night hunting for slugs, and being well overhauled in the morning, when, in spite of all possible care, some of our best roots and most promising flower-spikes have been found to be eaten through. Again, the unsightliness would be an obstacle in most establishments. The plan has not even the plea of being natural, for Orchids, and especially epiphytal Orchids, are found on isolated trees and rocks, and on the outskirts and openings in the forest, and by the sides of rivers and lakes, where the air is comparatively free, but rarely in the thick depth of the forest, or jungle, where the atmosphere is redundant with the odour of decaying vegetable matter. *W. Chapman.*

**Rules for Heating Conservatories.**—Mr. Makenzie's letter in last Saturday's *Gardeners' Chronicle* concludes his correspondence under the heading of "Art in the Conservatory and Greenhouse," with some pleasant remarks on my late lecture, reported in your pages, and his allusions, of course, have given me satisfaction; but I must not therefore hesitate to remark that he himself has failed to contribute anything fresh on the subject. He has only told us what was already well known about the branch of the subject to which his critical remarks more especially refer, viz., the proper modes of calculating the quantity of hot-water pipes required for heating conservatories. The substance of his letters resolves itself into two counts. Firstly, that all the rules I gave could possibly be made conflicting, and secondly, that I had cribbed them without acknowledgment from Hood's work on *Heating and Ventilation*, a book to which he says he, in common with all engineers and horticulturists, is indebted. Permit me to say with reference to the last indictment that personally I had never seen a copy of Hood's volume till one day last week, and that instead of borrowing from any printed rules I consulted an experienced horticultural engineering friend whose advice I coupled with my own practical knowledge of the matter; and should it be found that such combined information agrees with what was already known by experts, I cannot see that there is anything to cause surprise if the rules thus recommended correspond somewhat with those set forth perhaps years ago in standard works on the subject. Mr. Makenzie's first count, however, is not so readily answered, and I can but regret that he has made no attempt himself to solve the difficulty which he has thus brought forward. He simply laughs at me, saying, "Ha! ha! your rules are conflicting." But

surely this is a very commonplace thing for so able a correspondent to do unless he furnishes me with a better and more reliable rule. I am not an engineer, neither do I pretend to be a horticulturist, but as an architect I have spared no pains to find such data as should be easily read as a rule to be more generally applicable and yet as concise and simple as those already referred to. I care not how drastically criticised my rules may be, provided my critics will furnish better ones themselves, for which no one would thank them more than I. Will not some of your practical and experienced readers who have not yet spoken, answer my question by giving a better rule by which the proper quantity of hot-water piping may be secured for working without waste and needless outlay? Reliable information is certainly needed on this point by very many besides myself. *Maurice B. Adams, A.R.I.B.A., Bedford Park, Chiswick, W.*

**Aquatic Plants.**—I was glad to see attention called at p. 177 to that beautiful class of plants, the aquatics. The setting of water in which they are enclosed and mirrored adds greatly, to my mind, to their natural beauty. In addition to those which you have noticed allow me to mention, as well worth attention, the double variety of Arrow-head, which forms beautiful spikes of flowers; Calla aethiopia, with its majestic clusters of leaves and tall white flowers; and Aponogeton distachyon, which is in flower almost the whole year round, and seeds and forms new plants with the greatest freedom. All these seem to be perfectly hardy and quite unaffected by frost, except, of course, such portions of the plant as are exposed to the air. Fresh-water plants are much addicted to rambling, and I should advise those who grow many kinds in one pond to plant them in stations or pots; by this means they can be kept under control, or they are apt to grow into tangled intermingled masses and the stronger plants will destroy the weaker. Two plants I have failed to grow—the flowering Rush, *Butomus umbellatus*, and the Water Soldier, *Stratiotes aloides*: I should be much obliged if any correspondent would give me any hints on the cultivation of these plants. In my part of Sussex there is iron in almost all the water, and lime is almost absent from the soil. The first is irremediable, I have endeavoured to remedy the latter by adding chalk, but the flowering Rush will not grow. One defect may be admitted to exist in water plants, viz., that there is little variety of colour—almost all being either white or yellow; this has led me to wish that some one who has the power of doing so would try whether our Water Lily can be hybridised with the blue or pink varieties from the tropical rivers. This would be painting the Lily, but how beautiful our common Nymphaeas would be if shaded with red or blue: the flower is larger and finer than those of the coloured varieties would seem to be. Perhaps I am suggesting an impossibility, but success if attainable would be a great gain to the lovers of aquatics. *Saxerianis.* [The Swedish Nymphaea albo-rosea just meets your want. *Eds.*]

**The Establishment of Cinchona Plantations in Jamaica.**—The article at p. 728, vol. xii., appears to indicate that the ex-Superintendent of Cinchona plantations in Jamaica lays claim to the sole credit of establishing the culture of the various species of Cinchona in Jamaica. That he had a share, and a large one too, in contributing to the success of the project cannot be denied, but when he takes the entire credit for what is now a successful venture, to the disparagement of an old and able public servant (now departed), he invites criticism as to his assertions therein put forth. Mr. Thomson says in his article, quoting from his own report (wherein he describes occurrences rather minutely which took place two years or more before his arrival in this island), that "the Secretary of State for India authorised the collectors to transmit seeds simultaneously to Jamaica." At whose suggestion, I would ask? Can Mr. Smith tell us that? or is the extract from one of Mr. Wilson's letters sufficient? Writing in 1860, he says:—"I am glad to hear that the Indian Government has taken up the subject of the introduction of quinine-producing plants into India, but I think they have done wrong in not making this island a central depot for the plants." This shows what he thought the island capable of. In another letter:—"Sir W. Hooker has been in communication with our Governor on the subject, and I have freely promised to give all the assistance I can in establishing a plantation on the hills." That he was well aware what elevation was required is also evident from his letter, saying, "I shall require a field of 60 acres at 4000 to 5000 feet." Why the spot selected should have been lower, was possibly for reasons over which he had not sufficient control. The site doubtless proved unfortunate (1863), but was nothing done in the way of selecting another site until 1867, when Mr. Thomson says "I selected sites for plantations"? What was Mr. Wilson's capacity when he wrote in 1865 "the Cinchona plantation is

thriving"? Why this silence of your correspondent of this period? If the site above Bath failed in 1863, where was the tree "in flower, 10 feet high," in 1865 (of which Mr. Wilson wrote), planted? Under whose superintendence was this plantation established? We learn at this period that Mr. Thomson was Mr. Wilson's assistant. That the task of carrying out the work initiated by Mr. Wilson did fall into the hands of Mr. Thomson, and that credit is due to him for the manner in which the undertaking was carried on, no one disputes. The experience gained while working under his predecessors served him in good stead, and he was thus enabled to avoid the errors, and adopt those conditions necessary to successful cultivation as a final result of his and his predecessor's experience; but to lay claim, as he appears to do, to the sole credit of establishing Cinchona cultivation in Jamaica, is considered absurd by one who in truth and honour wishes to see "honour given to whom honour is due." *Gyges.*

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 13, 1880.

Feb. 12.—Overcast, dull till 11 A.M. Fine and bright after. Cloudless at night. Little rain before 10 A.M.  
 — 13.—A very fine clear day. Light breeze. Cool.  
 — 14.—A dull, overcast day. Frequent rain in morning and evening.  
 — 15.—Dull till noon, fine and bright till 2 P.M. Dull after. Frequent rain after 4 P.M.  
 — 16.—Dull and wet in morning. Fine in afternoon and evening. Overcast at midnight. Occasional showers in afternoon, and again after 11 P.M. Strong wind.  
 — 17.—A fine bright day. Mild. Heavy rain and strong gale in early morning. Cloudless at night.  
 — 18.—Fine and bright till evening, then wet and dull. Strong wind. Rain before 9 A.M., and after 7 P.M.

**LONDON: Barometer.**—During the week ending Saturday, February 14, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.49 inches at the beginning of the week to 29.66 inches by the evening of the 8th; decreased to 29.18 inches by the evening of the 9th; increased to 29.86 inches by the evening of the 11th; decreased to 29.79 inches by the morning of the 12th; increased to 30.24 inches by noon on the 13th; decreased to 29.84 inches by the afternoon of the 14th; and increased to 29.88 inches by the end of the week. The mean reading for the week at sea level was 29.73 inches, being 0.43 inch below that of the preceding week, and 0.23 inch below the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 50½° on the 12th to 42½° on the 11th; the mean value for the week was 46¼°. The lowest temperatures of the air observed by night varied from 30½° on the 12th to 36½° on the 8th; the mean value for the week was 33½°. The mean daily range of temperature in the week was 12¾°, the greatest range in the day being 20¼° on the 12th, and the least 9°, on the 8th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Feb. 8, 40° 6', + 1° 5'; 9th, 40° 1', + 1°; 10th, 40° 3', + 1° 3'; 11th, 38° — 1°; 12th, 41° 3', + 2° 4'; 13th, 40° 2', + 1° 3'; 14th, 39° + 0° 2'. The mean temperature of the air for the week was 39° 9', being 1° above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 103¼° on the 13th, 97° on the 12th, and 85¼° on the 9th; on the 11th the reading did not rise above 50°. The lowest readings of a thermometer on grass, with

its bulb exposed to the sky, were 25° on the 12th, 27° on the 11th and 13th, and 28° on the 10th. The mean of the seven lowest readings was 28½°.

**Wind.**—The direction of the wind was S.W. and S., and its strength moderately strong.

The weather during the week was generally fine (especially so on Friday) though dull at intervals, and the sky cloudy.

Rain fell on four days during the week; the amount measured was 0.60 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, February 14, the highest temperatures of the air observed by day were above 51° at Truro, Bristol, and Sunderland, and below 48¼° at Brighton, Norwich, Wolverhampton, Hull, and Leeds; the mean value from all stations was 50¼°. The lowest temperatures of the air observed by night were below 30° at Wolverhampton, Nottingham, and Sheffield, and above 34° at Plymouth and Norwich; the mean from all places was 31¼°. The extreme range of temperature in the week was above 21° at both Truro and Nottingham, and below 16° at both Brighton and Norwich; the mean range from all stations was 19°.

The mean of the seven high day temperatures was above 48° at Truro, Plymouth, Bristol, and Sunderland, and below 45½° at Brighton, Norwich, Wolverhampton, Bradford, and Leeds; the mean value from all places was 47°. The mean of the seven low night temperatures was below 34° at Blackheath (London), Wolverhampton, and Nottingham, and above 36° at Truro, Plymouth, Brighton, and Norwich; the mean from all stations was 35°. The mean daily range of temperatures was above 14° at Truro and Nottingham, and below 10° at Brighton, Norwich, and Leeds; the mean daily range from all places was 12°.

The mean temperature of the air for the week from all stations was 40¼°, being 1¼° lower than the value for the corresponding week in 1879. The mean temperature was above 41¼° at Truro, Plymouth, Bristol, and Sunderland, and below 39¼° at Wolverhampton, Bradford, Hull, and Leeds.

**Rain.**—Rain fell on every day of the week at Bradford, and on five or six days at most other places. The heaviest falls were 1.18 inch at Truro, and three-fourths of an inch at Bristol, Bradford, and Sheffield; and the least falls were 0.27 inch at Cambridge and 0.35 inch at Leeds; the average fall over the country was six-tenths of an inch.

The weather during the week was tolerably fine, though wet, and the sky generally cloudy. A little snow fell at Bradford on the 8th inst.

**SCOTLAND: Temperature.**—During the week ending Saturday, February 14, the highest temperatures of the air observed by day varied from 50° at Glasgow, to 46° at Dundee; the mean from all places was 48¼°. The lowest temperatures of the air observed by night varied from 27° at Aberdeen and 28° at Paisley, to 32° at Edinburgh; the mean value from all stations was 29¼°. The mean range of temperature from all places was 18¼°.

The mean temperature of the air for the week from all stations was 39¼°, being 3¼° higher than the value for the corresponding week in 1879. The mean temperature was above 40¾° at Glasgow, and below 38° at Perth.

**Rain.**—The heaviest fall of rain was 1 inch at Greenock, and the least fall a quarter of an inch at both Edinburgh and Leith; the average fall over the country was half an inch.

**DUBLIN.**—The highest temperature of the air was 51¼°, the lowest 25¼°, the extreme range 26¼°, the mean 39¼°; and the fall of rain 0.47 inch.

JAMES GLAISHER, F.R.S.

### Answers to Correspondents.

**ABIES—PICEA: W. B.** Spruce Firs are true Piceas; Silver Firs are true Abies. Spruce Firs (Piceas) are known by their branches being rough, with projecting spurs supporting the leaves, by their leaves being more or less four-sided, by their cones being pendulous, and by the scales of the cone being persistent. Silver Firs (Abies) are known by their branches being smooth, their leaves flattish, their cones erect, their cone-scales deciduous. There are other more recondite differences, which we need not now detail.

**BRAMBLES: Enquirer.** You would have to cut and come again very often before succeeding.

**CAMELLIA: Y. C.** Many thanks; the appearance is due to the branching of the stem within the flower. We have frequently seen it.

**CHALK: Enquirer.** Yes; especially if the land is at all heavy.

**DENDROBIUM GIBSONI: C. R.** A fusion of the flower-stalks without other change.

**EPACRIS: W. C.** The following are good and distinct sorts:—*Epacris hyacinthiflora*, and *hyacinthiflora candidissima*, Vesuvius, Tauntoniensis Kinghornii, and Lady Panmure.

**ERICAS: W. C.** For six distinct Heaths of tolerably free growth, take *E. Bergeana*, *metuliflora bicolor*, *Parmentieri rosea*, *perspicua nana*, *odorata*, and *ventricosa coccinea minor*.

**INSECTS: Vto.** Send specimens for identification.

**NAMES OF PLANTS: C. E. F.** 1, *Cupressus Lawsoniana*; 2, *Cupressus Goebeniana*; 3, *Juniperus recurva*; 4, *Cupressus Lambertiana*; 5, specimen insufficient.—*T. A. Glover.* 1, *Rhododendron praecox*, or one of the other early hybrids crossed with *davuricum*; 2, *Blechnum o cidentale*; 3, *Senecio mikanooides*, the German Ivy; 4, *Asplenium praemorsum*.—*A. P.* 2, *Chameranthemum Beyrichii*; 3, *Asplenium praemorsum*; 4, *Lastrea quinqueangulare*; 5, *Asplenium flaccidum*. The others are too imperfect for determination.—*C. R.* 3, *Cacalia*, or *Kleinia articulata*; 4, *Farfugium grande*; 5, *Deutzia gracilis*; 6, *Begonia Rex*; 7, *Begonia Duchess de Brabant*; 8, *Cyrtomium anomophyllum*.—*Enquirer.* It is probably one of the seedling forms of *Ceanothus azureus*.—*J. B. S.* The evergreen tough-stalked Madeira form of *Cystopteris fragilis*, which you will find under the name of *Sempervivum*. It is a very distinct and interesting plant.—*Z. I.* *Casuarina equisetifolia*.—*J. Dap.* 1, *Hardenbergia monophylla*; 2, probably a *Thibaudia*; 3, *Acacia armata*; 4, *Pittosporum tenuifolium*; 5, *Jasminum grandiflorum*.—*Chapman.* The orange-red *Habrothamnus* is *H. fasciculatus*.

**PINUS DOUGLASH: Enquirer.** Yes; if the soil is not wet as well as heavy.

**CATALOGUES RECEIVED:—**William Fell & Co. (Hexham), Spring Seed Guide.—Charles Wilson (Salisbury, Warwick), Select Catalogue of Garden, Farm, Flower Seeds, &c.—Vilmorin-Andrieux & Co. (Quai de la Megisserie, Paris), Catalogue of Seeds of Hardy and Exotic Trees and Shrubs, &c.—E. B. Spence (8, Victoria Road, Darlington), Garden, Agricultural, and Floral Seed Catalogue.—M. Bruant (Boulevard Saint Cyprien, Poitiers, Vienne, Isère, France), Catalogue of New Begonias, Zonal Pelargoniums, Petunias, Verbenas, &c.

### Enquiries.

*He that questioneth much shall learn much.*—BACON.  
**BIRD SCARERS.**—A correspondent writes to ask whether no one manufactures a cheap, strong, useful "garden mirror" (it ought to be glazed, so as to reflect on both sides) for hanging, to revolve by a string, among Strawberry beds, to scare birds? He preserved all his fruit last year by means of suspended mirrors; but the rain and sun destroyed the frames speedily, and they had to be renewed. Why not manufacture a garden mirror in a waterproof and sun-proof frame? No other bird-scarer seems of the slightest good where birds are numerous. He once erected a windmill rattle in his garden, and in less than a week observed a bird sitting upon the machine gravely inspecting its mechanism.

**CRINUM RIPARIUM.**—I should be pleased if some one would give me a hint how to treat this plant with a view to getting it into bloom during September and October. *Ignorance.*

**SEED SAVING AND STORING.**—Can any of your correspondents inform me of any work which treats especially on the saving and storing of seeds? *W. R.*

## Markets.

COVENT GARDEN, February 19.

A general rise has taken place in our market in all sorts of first-class goods, late Grapes more particularly being in good demand, and St. Michael's Pines realising better prices. American Apples are reaching us in unusual condition, a few good samples making high prices. Trade generally better. *James Webber, Wholesale Apple Market.*

FRUIT.		VEGETABLES.

CUT FLOWERS.—WHOLESALE PRICES.

Table listing cut flowers such as Abutilon, Arum Lilies, Azalea, Bouvardias, etc., with their respective prices.

SEEDS.

LONDON: Feb. 18.—Messrs. John Shaw & Sons, 37, Mark Lane, state that a slightly improved general inquiry has prevailed during the last few days, but has not yet developed itself into much actual business.

CATTLE.

At Copenhagen Fields on Monday the very wet weather caused a depression in the trade, yet choicest quality beasts, being scarce, were cleared off at a slight advance.

HAY.

Tuesday's Whitechapel Market report states that there was a short supply, but the trade remained dull, and prices were as follows:—Prime Clover, 100s. to 125s.;

POTATOS.

The Borough and Spitalfields Markets reports state that the trade has remained inactive, but as the supplies are limited prices are without much change.

COALS.

The following are the prices current at market during the week:—East Wylam, 16s. 3d.; Bower's West Hartley, 14s. 9d.;

Government Stock.—On Monday the closing prices of Consols were, for the account, 98 1/4 to 98 1/2, and 98 to 98 1/2 for delivery.

TREE PLANTING: AN INVESTMENT.

That Timber Growing will be found to be a profitable application of the soil, and a sound investment to Capitalists in the future, is being made obvious by the increasing demand for Wood, and its anticipated scarcity in places abroad.

Nurseries have long been noted in Scotland for successfully and cheaply raising FOREST and other TREES, and the subscribers devote every attention to conducting efficiently one of the largest establishments in the country.

In connection with their business arrangements Correspondents are respectfully reminded that their Priced CATALOGUES are sent, post-free, on application. The prices are quoted as reasonable as any. Plants are fibrous-rooted, robust, and grow unsheltered. Inspection of Nurseries invited, but if inconvenient, Samples of Trees will be furnished. Planting contracted for, Carriage Rates lessened, and Packages saved by using "Through Trucks." Export Orders carefully supplied, and Correspondence solicited.

BENJAMIN REID & CO., FOREST TREE NURSERIES, ABERDEEN, SCOTLAND.

FIFTY ACRES OF FRUIT TREES.—Apples, Pears, Plums, Cherries, Peaches, Nectarines, Apricots, and other Fruit Trees, as Standards, Dwarfs, Pyramids, Bushes, Cordons and Trained Trees, in great variety, all full of vigour and warranted true to name. Descriptive Price List, containing a sketch of the various forms of Trees, with Directions for Cultivation, Soil, Drainage, Manure, Pruning, Lifting, Cropping, Treatment under Glass; also their Synonyms, Quality, Size, Form, Skin, Colour, Flesh, Flavour, Use, Growth, Duration, Season, Price, &c., for a penny stamp.

TWELVE ACRES OF ROSES.—Standard, Dwarf, and Climbing, all the popular sorts; also 80,000 choice Tea-scented and Noisette Roses in pots; extra strong Roses in pots for immediate forcing. See Descriptive Price List, free for a penny stamp.

GRAPE VINES and ORCHARD HOUSE TREES in POTS.—Grape Vines, extra strong, and warranted free from Phylloxera, Oidium, and all disease; Planting Canes, 3s. 6d. to 5s. each; extra strong Fruiting Canes, 5s. 6d. to 10s. 6d. each. Orchard-house Trees, fruiting in pots, consisting of Peaches, Nectarines, Apricots, Plums, Cherries, Pears, Apples, and Figs. Descriptive Price List for a penny stamp.

WORCESTER PEARMAN APPLE (awarded a First-class Certificate by the Royal Horticultural Society).—One of the handsomest and most useful Apples in cultivation. For full description see "Extract from the Journal of Horticulture," and RICHARD SMITH & CO.'S Fruit List, which may be had for a penny stamp. Coloured Plates, 6d. each. Maiden Trees, 1s. 3d. each; Bushes, 2s. 6d. each; Standards, Pyramid and Dwarf-trained Trees, 3s. 6d. and 5s. each.

LIST of all the EVERGREEN FIR TRIBE, suitable for Britain, giving size, price, popular and botanical names, derivations, description, form, colour, foliage, growth, timber, use in arts, native country, and size there, situation, soil, and other information, with copious index of their synonyms. Free by post for six stamps.

LIST of STOVE and GREENHOUSE PLANTS, comprising the best selections of Camellias, Azaleas, Ericas, Epacris, Ferns, &c., free for a penny stamp.

LIST of EVERGREEN and DECIDUOUS SHRUBS, RHODODENDRONS, STANDARD ORNAMENTAL TREES, CLIMBING and TWINING PLANTS, with their generic, specific, and English names, native country, height, time of flowering, colouring, &c., and general remarks, free for a penny stamp.

ALL kinds of GARDEN SEEDS, of first quality, BULBS, MUSHROOM SPAWN, TOBACCO PAPER, ARCHANGEL MATS, and other GARDEN REQUISITES. See Lists, which may be had on application.

**TO Gardeners.**  
**FOR TOBACCO PAPER** apply to  
**H. BAILEY**, 63, Weston Street, Bolton, Lancashire.

**CUPISS'S CONSTITUTION BALLS.**

This justly celebrated Medicine for more than 30 years has proved to be the best and cheapest for **HORSES and NEAT CATTLE**, Cheaper because required to be given only once a week, and not every second or third day, **PRESERVING HEALTH, VIGOUR and CONDITION.**  
 Their cost, too, is saved by the food turning to a better account, for it is a fact that Horses will keep up their condition better upon three feeds of Oats daily when a Ball is occasionally taken than with four feeds without the Balls.  
**REARERS OF NEAT CATTLE** Will find the Balls most valuable, not only in case of disease, but in Rearing Young Stock, they will grow to a Larger Size, come to Perfection Sooner, and to a Greater Weight with the same quantity of food if a Dose (see directions) of the Balls is given occasionally.

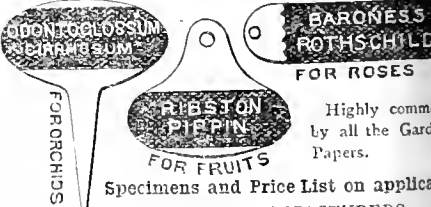

Prepared by the Proprietor,  
**FRANCIS CUISS, M.R.V.C.S., DISS, NORFOLK.**  
 Author of the PRIZE ESSAY on the "Diseases of the Liver of the Horse."  
 Sold by all Chemists, in Packets at 1s. 9d. and 3s. 6d. each; or 7 large Packets for 21s., or 7 small for 10s. 6d. Gentlemen using the Balls may consult the Proprietor gratuitously.

**GARDEN STAKES, LABELS, VIRGIN CORK, MATS, RAFFIA, &c.** None cheaper. Prices of **WATSON AND SCULL**, 90, Lower Thames St., London, E.C.

Under the Patronage of the Queen.

*In reply to MR. BRAMHAM, we are quite willing to maintain, by Trial, the superiority of our Boilers over those not made in imitation of ours; but to make Mr. B.'s suggestion bonâ-fide, we think the makers or proprietors of the Boiler intended to be entered against ours should themselves come forward in their own proper persons, and not through the agency of a third party. When this is done arrangements can then be considered as to conditions, range of tests, deposit of expenses, and awards, committee of management, and general details.*

**JONES & ATTWOOD.**

**ENGINEERS and IRONFOUNDERS,**  
 STOURBRIDGE.

JONES'S IMPROVED EXPANSION JOINT. THE BEST HOT-WATER JOINT.

Medal Awarded Horticultural Show, Aston, 1875.

SIMPLE, DURABLE, NEAT, CHEAP. Specially adapted for CHURCHES, SCHOOLS, MANSIONS, PUBLIC BUILDINGS, &c.

Illustrated CIRCULAR and Price LIST; also Estimates for Heating with the most improved BOILERS, EXPANSION JOINT PIPES, or COILS, on application.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.

From Mr. CHARLES YOUNG, Nurseries, Balham Hill, S.W., May 29, 1873.  
 "Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work"

PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.

**KINAHAN'S LL WHISKY.**

**KINAHAN'S LL WHISKY.** Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession, The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.** Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.** Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.

**EPPS'S COCOA.**

**GRATEFUL AND COMFORTING.**

JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.

**DINNEFORD'S MAGNESIA.**

The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, and INDIGESTION,** and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**

**HOLLOWAY'S PILLS and OINTMENT.**

—These corrective remedies enable the strong to preserve their health, and afford an easy means for the weak and ailing to restore it. Working at high pressure as thousands daily do, to support life, it is but little wonder that the digestion becomes defective, the heart irritable, the bowels constipated, and the mental faculties dimmed. Let all such sufferers apply themselves at once to these medicaments, and use them according to the plain directions which accompany them; then the disordered functions will soon respond to their action, and the physical and mental powers will be quickly recuperated, producing a feeling of lightness and ease which in itself is worth its weight in gold.

See Special Large Advertisement for Cuttings, February 14, and every particular in H. C.'s "Floral Guide," sent free for twelve stamp.

From Mr. Woodcock, The Gardens, Sandfield, Rochdale.

"DEAR SIR,—The Plants sent by you reached here quite safe, and beautifully packed. Also, I cannot but express my mind to congratulate you on the great success you have achieved in raising and collecting together such jewels and gems of floral beauty. Yes, it strikes me with wonder. Why, what must us old gardeners expect to see next?"

**NEW SCARLET and PURPLE PRIMULAS.**

Why grow the old ordinary kinds when you can have the colours nearly as bright as the Zonal Pelargoniums?

Per pkt. s. d.	These are totally away from all other, and even superior to the Chiswick Red and rubro-violacea which were awarded First class Certificates last November.
SWANLEY RED..... 5 0	
SWANLEY PURPLE . 5 0	
SWANLEY CRIMSON 2 6	

My Primula-house can now be seen. The finest collection ever brought together.

The Editor of the *Gardeners' Magazine* says the crowning glory of the group is the great Single Red, the colour deep and rich, with a fine fiery glow.

SEND FOR A CATALOGUE.

The "Christian Union" says:—

"MR. CANNELL'S HOME FOR FLOWERS at Swanley, Kent, is known to all florists for its varied excellencies, but it is well that it should be known to multitudes who may not be professional florists, but who have a really good and natural liking for a pretty flower or plant in their private gardens, verandahs, or window sills. Everything in the enjoyment to be obtained from this period onward through the season depends on the stock from which the seeds or plants are derived. Mr. Cannell's establishment at Swanley is devoted exclusively to Florists' flowers, and is probably the only one in the kingdom of which this can be said; and as Mr. Cannell himself is a Fellow of the Royal Horticultural Society, every one may judge what results ensue from a highly specialised direction of this kind under the most ample science and experience. In looking over the Descriptive Catalogue of Seeds one perceives the immense variety of genera and species therein embraced; but the testimonials appended are still more convincing and carry a more palpable weight of evidence to the general mind. The testimonials come not only from every quarter of the United Kingdom, but from India, Australia, and others parts of the world to which English culture in other forms has so widely and permanently spread. His Seeds are of the highest excellence. It is one of the greatest of all the wonders in the floral culture of this country."

SEED CATALOGUE POST-FREE.

**CALCEOLARIAS (Spotted).**—H.C.'s best Strain in 60's, 2s. 6d., by post; 2s. per dozen. Special price per 100 and 1000.

**HENRY CANNELL, (F.R.H.S.) THE HOME FOR FLOWERS, SWANLEY, KENT.**

**GYDE'S IMPERIAL FERTILISER**

FOR

Flowers, Fruit, & Vegetables.

Established 1839.

40 YEARS of

INCREASING SUCCESS.

Perfection in Artificial Manures for all Plants on British Soil and Conservatories.

Numerous Testimonials from all parts of the Kingdom justify us in stating that our different Manures and Plant Foods are perfect.

**THE IMPERIAL FERTILISER**

Is a highly-concentrated Manure, and is admitted by all practical Men who have tried it to be the very best ever offered to the public. Some Manures give beauty of bloom at the expense of the plant's vitality, causing a consumption of the plant's stamina and roots, in order to produce, as it were, a hectic flush of short duration; whereas in every case the bloom on a plant nourished on our Imperial Fertiliser is a proof of sound health.

It also gives abundant growth to Vegetables, and fertility to all.

**RESPONSIBLE AGENTS WANTED.**

1 cwt., 16s.; ½ cwt., 9s. 6d.; ¼ cwt., 7s.; 14 lb., 5s.; Tin, 1s.

To be obtained of principal Florists and Seedsmen.

**GYDE'S AMAZONAS SANA COPIA POTATO MANURE (REGISTERED)**

Is a high-class Fertiliser. It is also a great Preventive of Disease, and by using a fair quantity will increase the size and yield twofold.

We wish to call attention to the extract below, from *Farm Journal*, Jan. 17, 1880:—

**EXTRACT.**

"One step in the right direction has been taken by the proprietors of Gyde's Chemical Manure Works, Stroud, Gloucester, in that, confident of the success of their Amazonas Sana Copia Potato Manure, they have established a register of those who use their manure, so that growers in distant parts may exchange sound seedlings. This is manifestly a great advantage. We do not, of course, profess any practical knowledge of the Sana Copia Manure; but we have seen letters of perfect satisfaction concerning it, speaking in such terms as have led us to hope the evil days for the Potato may soon leave us. These letters, or testimonials, would not of themselves justify us in calling the attention of our readers to a comparatively unknown article; but we have every confidence in the firm, that they conscientiously believe what they say concerning it. One paragraph in their circular particularly took our notice. They profess that their Sana Copia Manure so strengthens the plant that it can defy unfavourable atmospheric influences; and we cannot see that it can do this without also enabling it to resist disease through the soil."

Supplied in 1 cwt. Bags

Price, £12 per ton; 12s. 6d. per cwt.

Carriage paid on orders of 5 cwt. and upwards within 100 miles of the Works.

**ALL kinds of GARDEN SEEDS**, of first quality, BULBS, MUSHROOM SPAWN, TOBACCO PAPER, ARCHANGEL MATS, and other GARDEN REQUISITES. See Lists, which may be had on application.

**TREE PLANTING: AN INVESTMENT.**

That Timber Growing will be found to be a profitable application of the soil, and a sound investment to Capitalists in the future, is being made obvious by the increasing demand for Wood, and its anticipated scarcity in places abroad.

Nurseries have long been noted in Scotland for successfully and cheaply raising FOREST and other TREES, and the Subscribers devote every attention to conducting efficiently one of the largest establishments in the country.

In connection with their business arrangements Correspondents are respectfully reminded that their Priced CATALOGUES are sent, post-free, on application. The prices are quoted as reasonable as any. Plants are fibrous-rooted, robust, and grown unsheltered. Inspection of Nurseries invited, but if inconvenient, Samples of Trees will be furnished. Planting contracted for, Carriage Rates lessened, and Packages saved by using "Through Trucks" Export Orders carefully supplied, and Correspondence solicited.

**VALUABLE EAST INDIAN ORCHIDS.**

**MR. J. C. STEVENS** has received instructions from Mr. F. SANDER to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, March 8, at half-past 12 o'Clock precisely, a very extensive Importation of

**EAST INDIAN ORCHIDS,**

consisting of the finest lot of **VANDA CÆRULEA** ever brought to Europe, and collected by Mr. W. B. FREEMAN in a new locality; the plants are full of growths, one mass having not less than twenty-four, and in most perfect health, with sound green leaves. The Sale also contains a grand lot of the rare and beautiful **DENDROBIUM FREEMANI**, Rchb. f., many of them in bud and flower, and mostly with flowering growths—all in perfect health.

Also an Importation of **AERIDES FIELDINGI** (Fox-brush) in splendid masses, **ODONTOGLOSSUM VEXILLARIUM**, **VANDA TERES**, **MORMODES PARDINUM**, various **CÆLOGYNES**, and other ORCHIDS.

May be viewed the morning of Sale, and Catalogues had.

By Her Majesty's Royal Letters Patent.

## RENDLE'S PATENT SYSTEM of GLAZING,

For Conservatories, Plant Houses, Orchard and Stove Houses, &c.

This invention is now adopted by Her Majesty's Government, all the leading Railway Companies, Public Buildings, Winter Gardens, &c., throughout the country.

### Rendle's Patent Portable Glass Protectors for Walls.

For Protecting Peaches, Nectarines, Apricots, and other choice Fruit Trees, from Spring Frosts, heavy rains, &c.

A wall 50 feet long can be protected for £7 10s., and a most perfect protection too. Frost comes like rain—straight down the wall. The tender blossoms of the Peach and Nectarine are most affected by frost after heavy rains; they get wet, and the frost comes and destroys their vitality.

#### Prices.

Patent Glass Copings, 16 oz. Glass, 18 in. wide, 3s. per run. ft.  
 " " 21 " 24 " 4s. "  
 " " 21 " 30 " 5s. "

### Patent Portable Glass Wall Protector.

The Screens will be supplied all complete, with glass, patent metal groove, uprights, &c., for 15s., 18s., 20s., and 24s., per running foot, according to the height of the wall and the width of the border. This is the cheapest glass structure ever invented.

Fruit Walls converted into Orchard-houses on the above simple and most efficient system, from 23s., 24s., 26s., 30s., to 34s., per foot run, according to the height of the wall and width of the border.

In the front thousands of Bedding Plants can be stored away, and it will be a most valuable House for growing all kinds of Spring Vegetables, such as Lettuces and Salads, early Potatoes, Strawberries, Violets, and a thousand other things.

These ORCHARD HOUSES can be built without any brickwork, so that they can be taken down and put up again in another position, and shifted as easily as a Garden Frame.

For all other information see Illustrated Catalogues and Books of Design, which can be obtained from the Inventor and Patentee,

SATURDAY, FEBRUARY 28, 1880.

VEGETATION OF THE KURAM VALLEY, AFGHANISTAN.

WE have more than once alluded to the collection of dried plants brought home, towards the end of last year, from Afghanistan, by Dr. J. E. T. Aitchison. At the meeting of the Linnean Society on Thursday, the 19th inst., that gentleman read a paper on the vegetation of the Kuram Valley, a district which he traversed and botanised by different routes on the outward and homeward journeys of the expedition to which he was attached. The Kuram River, if we may so term it, for it consists in the upper and middle parts of its course of three or four parallel streams, besides their numerous lateral affluents, is a tributary of the Indus, rising near Shutargardan to the south, and a little eastward of Cabul. It is separated from the valley of the Cabul River by the principal ridge of the Sufaid Koh Mountains, which is in about 34° N. latitude.

The part of the country explored by Dr. Aitchison covers about a degree of longitude, lying, roughly speaking, between 69° 30' and 70° 30'; and it is an elevated, mountainous generally well-watered region, possessing a rich and varied vegetation. This, however, is only a general statement, for in some parts of his journey he came upon arid tracts, where the flora consisted mainly of prickly undershrubs and herbs, such as species of Astragalus, Acantholimon, Cousinia, &c.; and the range of altitude was from about 2250 feet to upwards of 15,000 feet. The climate, as may be inferred from the geographical position, is temperate and continental—that is, characterised by a wide difference in the summer and winter mean temperatures. A hot dry summer favours the development of many plants that would not flourish in our moister, cooler climate, although they all belong to essentially temperate types that could withstand the cold of our winters.

Dr. Aitchison commenced collecting in April and continued until the middle of the autumn, and in an area of something like 50 or 60 miles long by, say, 10 miles in its greatest width, he collected nearly a thousand species of flowering plants and Ferns. Considering the circumstances under which the work was done, we may perhaps assume that he did not collect more than two-thirds of the species that actually exist within the area indicated. On the other hand, the majority of the species overlooked would be either rare or of small dimensions, so that the collection he has made doubtless well represents the flora of the region, and includes all the characteristic plants. In consequence of having to start for Afghanistan again early next month, Dr. Aitchison has been unable to work up his collection critically; but with the assistance of Mr. Baker, Mr. Hemsley, and others, he has determined the genera and the species of a very large percentage of his plants, and descriptions have been drawn up of the most interesting novelties. We

can only find space for some of the more interesting features of Dr. Aitchison's paper. It may be mentioned, by way of explanation, that the region explored by Dr. Aitchison had not been previously botanised, though Griffith, who accompanied the expedition of 1839-40, made a complete circuit of it, having travelled from the Punjab, by way of Shirkapur, Quetta, and Candahar, to Cabul, and thence down the valley of the Cabul River by way of Jellalabad and Peshawur back to the Punjab.

Griffith estimated the number of species collected by himself at about 1500, and this collection represented nearly all our previous knowledge of the flora of Afghanistan. The numerous difficulties and disasters attending the expedition reduced Griffith's collection to so broken and fragmentary a condition that many of the specimens of undoubtedly undescribed species were insufficient for description. Dr. Aitchison's collection, numbering many thousand specimens, arrived at Kew in a perfect state of preservation, and besides the new species it contains, it largely supplements the imperfect material of many species represented in Griffith's collection. It is noteworthy that although a large number of the same species occur in both collections, it is just the characteristic genera of the Western Asiatic flora that are represented by different, often undescribed species. Thus all the species of *Acantholimon* collected by Dr. Aitchison are new, and different from those collected by Griffith; and the majority of the most striking at least of Dr. Aitchison's novelties belong to such genera as *Astragalus*, *Oxytropis*, *Cousinia*, *Nepeta*, *Sedum*, *Saxifraga*, *Pleurospermum*, *Cotyledon*, *Eremurus*, &c.

The time being so short, Dr. Aitchison could not extract nearly all the interesting facts his collection supplies, but he hopes to return with more material, and then work it all up together in a thorough manner. Broadly, the flora of the region he explored may be said to consist of three principal elements, namely, the Himalayo-Chinese, the Levantine (including Persian), and the endemic. What proportions these elements bear to each other has yet to be worked out. With the exception of a Poplar, which may be a new species, or only a small-leaved variety of *Populus nigra*, no new species of tree was discovered. Among new shrubs, two *Rhododendrons*, a yellow Rose, a Clematis, and a Polygonum, are noteworthy. The Rose is, in many respects, not unlike *R. pimpinellifolia*, but the prickles are all of one kind, instead of large ones interspersed with smaller bristly ones, and the flowers are yellow. This Rose, Dr. Aitchison says, is one of the commonest shrubs in some parts of the country. The flowers are only about an inch in diameter, but they are exceedingly numerous, and are borne on short lateral shoots all along the branches. In foliage the two *Rhododendrons* are so much alike that it is difficult to distinguish them without close examination, yet one is poisonous to cattle, whilst the other is harmless. Both of them have small flowers, and will not be sought after on account of their ornamental character. Not so with the Clematis, a specimen of which, as well as of several other novelties, was exhibited at the Linnean Society's rooms. Associated with foliage very like the Central Asian variety of *Clematis alpina*, it has large lemon-coloured flowers 5 inches in diameter when fully expanded. Unfortunately no ripe seed of this plant was collected.

Among bulbous or rather tuberous-rooted plants is a fine new yellow-flowered *Eremurus*, nearly twice as large as *E. aurantiacus*. The leaves of the latter Dr. Aitchison mentioned form an excellent vegetable, equal, if not superior in flavour to Asparagus. Many of Dr. Aitchison's notes on the uses of plants are interesting, none more so than that the tuberous

root of a *Nepeta*, *N. raphanorrhiza*, which is a delicious vegetable. Another interesting object exhibited was a specimen of the bark of *Pinus Gerardiana* (Wallich), the outer layers of which are deciduous, falling away in plates, leaving a beautifully variegated and figured surface. In conclusion, we wish Dr. Aitchison a safe return, laden with botanical specimens. He expects to be in Cabul by the middle of May, so he may be early enough to collect spring-flowering bulbous plants on the route, should collecting be practicable.

## New Garden Plants.

*OCTOMERIA SAUNDERSIANA*, n. sp.\*

A curious little gem, with a very thick terete subulate leaf, exceeding 2 inches in length, standing on a much shorter stem. Flowers ochre-coloured, with three longitudinal purple stripes on the sepals and petals. Lip ochre-coloured, with a disk and calli mauve, and a mauve streak in front, and numerous similarly coloured dots around. Column white on the back, with three mauve stripes, and the anterior surface also mauve. It is of Brazilian origin, and flowers now (January, 1880) for the first time in the Hamburg Botanic Garden. I had it from the late Mr. Wilson Saunders, and I am pleased to name it in memory of our lost friend, who had the warmest heart for horticulture and systematic botany. *H. G. Rehb. f.*

*ANGRÆCUM HYALOIDES*, n. sp.†

This plant is in growth a miniature of *Angræcum citratum* according to the remark of Mr. Harry Veitch—the leaf sent by him—very thick, cuneate oblong with an oblique acute point giving evidence of this. It has a very short and small peduncle, with a single small hyaline flower having ligulate sepals and tepals, an oblong lip and a filiform, rather clavate spur surpassing in length both the sepals and ovary. There are a few more bracts, which are triangular and very short. Whether it will finally bear a few flowers at once or at distant periods cannot be said, though the latter seems the more probable. The pedicel is green at its base. Anther and pollinia ochre-coloured. The whole pollen apparatus is decidedly what I should expect in a "tip-top" *Angræcum*. It was imported from Madagascar by Messrs. Veitch, and claims a place amidst the "gems." *H. G. Rehb. f.*

*LÆLIA PERRINII* (Lindl.) NIVEA.

I have seen this but once previously, in Herr Consul Schiller's collection near Hamburg. It has pure white flowers, with a purple end to the lip, and thus looks very pretty. When decaying it takes a very light rosy hue. The same variety has appeared after a very long interval in the collection of M. Massange, Baillonville, near Marche, grown by the skilful and enthusiastic cultivator, Mr. Wilcke. *H. G. Rehb. f.*

## PELARGONIUM MRS. CANNELL.

THIS, as described in the last number of the *Florist and Pomologist*, is a striking advance in the true Ivy-leaved section, being "the largest and by far the best shaped flower yet obtained. It is a plant of vigorous growth, and therefore well adapted for growing on into a specimen. The flowers are large in size, perfect in form, stout and durable in substance, and produced in bold, well-filled trusses, while the colour is a deep mauve-like lilac or purple, beside which all the other similarly coloured sorts look pale and ineffective." To Mr. Church, a hybridist of some years' standing, is the credit due for raising the variety, which Mr. Cannell will in due time send out.

\* *Octomeria Saundersiana*, n. sp.—Caulis secundario vix pollicari; folio tereti apice subulato, antice canaliculato, ultra duos pollices longo; floribus geminatis (nunc fasciculatis); sepalis triangulis tepalis subæqualibus; labello trifido, lacinias laterales triangulis dorso obtusis, lacinia media oblonga acuta, parce undulata, carinis geminis inter lacinias laterales; columna clavata, incurva.—Sepala ocreacea, striis purpureis ternis. Tepala æqualia. Labellum disco postice violaceo-purpureum, antice stria mediana violaceo-purpurea, guttulis violaceo-purpureis circumjectis, ceterum ocreaceum. *H. G. Rehb. f.*

† *Angræcum hyaloides*, n. sp.—Pusillum, habitu *Angræci citrati*; folio cuneato-oblongis oblique acutis; racemis brevissimis; flore uno evoluto, bracteis 2-3 superioribus omnibus triangulis brevissimis; sepalis tepalisque oblongo ligulatis obtuse acutis; labello oblongo, calcar filiformi apice clavato ovarium pedicellatum excedente; pollinariis caudiculis simplicibus.—Ex Madagascar, importatum a cel. Veitch. *H. G. Rehb. f.*

## NEPENTHES BICALCARATA.

WITH reference to the remarkable Pitcher-plant introduced to Messrs. Veitch's nursery by Mr. Burbidge, and of which we gave an illustration at p. 201, we are now in a position to publish additional information, received by us from Mr. Burbidge. The details given by that observant naturalist are of very great interest as throwing light on the possible causes of the singular organisation in question, or, at any rate, as illustrating the interdependence of insects, plants, and animals. The substance of Mr. Burbidge's note, together with an illustrative specimen, was read before the Linnean Society at its last meeting.

"The stalk of the lower bag or ampulla-shaped pitcher is swollen and hollow, and in their native country, most of them are perforated by a species of black ant, which forms its colonies in the old and dry pitchers, and continually visits the fresh ones, so far as I could determine, for the purpose of obtaining food and water, since these fresh pitchers contain a miscellaneous collection of dead and decaying insects of many kinds. I noted that they also visited the uppermost pitchers which are frequently extended at a distance of 20 to 50 feet overhead in the trees up which this species climbs, its stout stem being like that of a Grape Vine. As the point grows up through the branches the prolonged midrib 'takes a turn' around the nearest branch, and so the weight of the stem, leaves, and ewers of water is supported in mid-air, and a perfect shower bath of water and a torrent of ants is the result of tearing them down. The ants cut the little round hole, and I believe that the swelling of the pitcher-stalk is consequent on this operation on their parts, of which there are many other instances in the vegetable kingdom. As these pitchers are perfect traps to creeping insects of ant-like character by reason of the incurved ridges round the throat of the pitcher, these black ants ingeniously perforate the stalk, and so obtain their supplies, and provide a means of exit in case of need. We have something analogous to this in the bees, which bite a hole at the base of the flowers of the Broad Bean, the Kidney Bean, and those of the narrow-tubed Achimenes. If you will look over the series of pitchers in Messrs. Veitch's museum at Chelsea, you will find many of the pitchers with their stalks thus perforated and swollen. The finest pitchers are those borne on offshoots or side breaks from the portion of the main stem which lies along the ground, where it becomes covered with moss and fallen leaves. These breaks grow up to a height of 2 or 3 feet, bear splendid leaves 2-3 feet long and 4-6 inches broad, of a fresh green colour, and every one is terminated by a splendid pitcher, which being partly full of water (derived from the leafy watersheds above) is borne down to the ground and rests partly, sometimes wholly, buried in the moss and leaves which cover the earth like a carpet, and form with the tropical heat a fine propagating bed for seeds, and for the growth of Ferns and lowly forest herbs and fine-foliaged plants. The top pitchers, like those of *N. Rafflesiana*, and other species of *Nepenthes*, are different in shape and position on their stalks to the lower ones. In this case they are cylindrical.

"Now a word as to the walrus-tooth-like prickles or spurs which lie concealed under the heart, or rather kidney-shaped lid of the urns. There is found in the Bornean forests, in the locality where this fine Pitcher-plant grows, a little animal called by the natives 'Tamperrillie,' and by the few Europeans who have ever seen it alive the Spectre Tarsier (*Tarsier spectrum*). It is a most singular and interesting creature, about the size of a large rat. Its head is singularly like that of a small kitten, the eyes being very large and full; the body is monkey-like, the tail slender and as long as the body, but bushy at the tip like that of the lion. Its feet are monkey-like, the second and third fingers shorter than the others, all are thin and bony, and have curiously enlarged disc-like tips, reminding one of the enlarged ends of the climbing tendrils of the Virginian Creeper. This little creature is an insect eater, and knowing that the pitchers of *Nepenthes* so very frequently contain entrapped insects, visits them pretty regularly. In the case of *N. Rafflesiana* the insects imprisoned in their unarmed urns are readily removed, but not so in the case of *N. bicalcarata*, as the sharp spurs are so placed that the Tarsier is sure to be pricked by them and pretty sharply too, if its head is placed under the lid for the purpose of inspecting the interior.

"The main question is of what use are the living ants, and the entrapped insects so universally found in all Pitcher-plants as they exist in their native habitats, and what end is this one species of *Nepenthes* made to serve as the nest of a peculiar species of ant. To suit its requirements not only is its very structure modified but special precautions are taken to ward off the insect-eating 'Tamperrillie.' I repeatedly saw this animal amongst plants of *Nepenthes bicalcarata*, and shot one or two specimens, and

the fact of its frequenting *Nepenthes* in quest of insects is well known to the more intelligent of native forest hunters.

"Borneo is indeed a country of many wonders. Beccari found there a parasitic plant which never fully develops itself until bitten by a large red ant. They make their nest in the swollen stem, and thence rush out to repel all intruders. A compromise is made for mutual benefit. I met with the same plant in the Labuan jungles, and often amused myself by hitting the swollen stems in which the ants hive themselves, in order to see them rush forth in great anger, searching hither and thither in quest of the foe.

"In the same island of Labuan is a bird called by the natives 'Burong Bukaka,' the Halyon Caromanda, or

child of Honduras, is another case in which ants make to themselves living tabernacles."

With reference to the *Myrmecodia*, alluded to in Mr. Burbidge's letter, it is a plant inhabiting the Eastern Archipelago, and is known to afford a residence to colonies of ants. Some excellent examples of the swollen underground stems of *M. armata* and *M. glabra*, recently sent from Borneo to the British Museum by Mr. H. O. Forbes, were exhibited by Mr. J. Britten at the same meeting of the Linnean Society. These, a series of both young and old plants, all—even the seedlings—bore evidence in tunnelled galleries of the ants' (*Pheidole javana*, Mayr.) indus-

AMERICAN ROSES.

A MONOGRAPH of Roses which are of American origin has, I believe, never before been attempted; not, perhaps, because there has been a want of interest in the subject, but because of the inherent difficulty in procuring reliable data. To discover the parentage of the various varieties, and the names of the raisers, has been an arduous undertaking, and I regret not being able to present a complete record; this, however, was hardly to be expected. Two classes have had their origin in America, the Prairie and Noisette Roses. These two classes give the most valuable climbers which we have, though our Transatlantic brethren do not take very kindly to the former. Besides these two classes, many varieties in other groups have had their origin in this country, several of which are leading sorts in all Rose catalogues of prominence, but our chief contributions must be considered the Prairie and Noisette varieties, as introducing new and very important groups.

The Prairie Rose (*Rosa rubifolia*) is indigenous to this country. Seeds of this were sown about 1836 by Messrs. Samuel & John Feast, of Baltimore. The seedlings from this sowing were then fertilised by some of the best Roses grown at the time, and from this lot came Baltimore Belle and Queen of the Prairies. The Messrs. Feast, together with Joshua Pierce, of Washington, have raised nearly all the varieties of this class possessing any merit. Though inferior in quality to the Tea Noisettes, their hardiness and vigorous habit make them of great value when the more beautiful Noisettes are too tender to be made useful. As an indication of their popularity we may state that, next to the Remontant Roses, H.P., more plants are annually sold of the Prairie than of any other class. Baltimore Belle when in blossom gives a display of which any one may be proud, whether the flowers are viewed individually or in the mass. It is much to be regretted that no further development of this really valuable class has been made. There is no reason why we should not succeed in obtaining a new class of hardy climbers which shall, in a great measure, combine the good qualities of the Hybrid Perpetual, Noisette, and Prairie Roses. By patient study and care this may be done; who is there that will do it? To accomplish this desired result the Prairie varieties might be made the seed parents, and fertilised by different varieties of Remontant and Noisette Roses known to be good seed-bearers, and that are otherwise desirable sorts.

A few years ago Mr. Henry Bennett, of Salisbury, England, commenced a series of experiments in the production of new Roses by artificial fecundation; selecting a number of sorts among the Tea and Hybrid Perpetual groups, and seeking, so far as possible, to combine and blend the several good qualities possessed by each. He has in this way founded a new, and what will certainly prove to be a very valuable class of Roses—the Hybrid Teas. Indeed it is my opinion that this group of Hybrid Teas will, by the improvements which are certain to be made, soon constitute our most popular class of Roses. What has been accomplished by Mr. Bennett is very good evidence, to my mind, of what can be done by us, in producing a class of hardy H.P. Climbing Roses.

In the list of American Roses there are several varieties with which I am unacquainted, and the descriptions, therefore, are those of the raisers, or, where in a few instances it was not possible to obtain these, they are described by reliable parties acquainted with the varieties. Whenever possible, both the name of the raiser, and the year when the variety was first sent out, are given.

PRAIRIE ROSES (*ROSA RUBIFOLIA*.)

These possess great vigour of growth, bloom late in the season in large clusters, and though the individual flowers lack many of the desirable features found in other classes, none are more effective in the mass. Anna Maria (raised by Samuel Feast, of Baltimore, Md., 1843), colour blush or pale pink, full flowers; has very few thorns. Anna Eliza (Williams), dark purplish-red. Baltimore Belle (Samuel J. Feast, 1843), white, with blush centre, of good full form. This seems to have some Noisette blood, which makes it a little tender in very severe winters; it is, however, the most beautiful and sought-after of the class. Eva Corinne, pale blush. Gem of the Prairies (raised

\* Extracts from a paper read before the West New York Horticultural Society, at Rochester, January 29, 1880, by Mr. H. B. Ellwanger.

FIG. 48.—IVY-LEAVED PELARGONIUM MRS. CANNELL. (SEE P. 264.)

great red kingfisher. Mr. Low sent eggs of this bird to the British Museum, and it is thus alluded to in the *Proc. Zool. Soc.* 1879, part. ii., p. 331:—"Burong Sakak, the large red or crimson kingfisher. The nest is said to be pendulous, and invariably to be accompanied in the same mass by a bee which is peculiarly vicious, so that the nest can only be robbed after destroying the bees; in the case of these eggs they (the natives) set fire to the whole unluckily. The nesting of this kingfisher in a bee's nest seems to be a point of some interest."

"In crossing the Tawarau River one eventful day, when bent on a long and tedious inland expedition, Mr. Peter Veitch and I found a Rubiceous plant, the young growth of which was much swollen, hollow, and infested with ants. There are dried specimens of this plant now in the Royal Herbarium at Kew.

"The *Schomburgkia tibicinis*, or Cow's-horn Or-

try and habitation. M. Beccari, who has studied *Myrmecodia* in its native localities, asserts that the presence of the ants is an essential to the plants' existence, for unless the young plants are thus attacked by the ants they soon perish. Sir Joseph Hooker mentioned that they formerly had a growing specimen of *Myrmecodia* at Kew, which, however, did not live long, but he was not prepared to say that the absence of the above burrowing ant would account for the unsuccessful rearing of the Kew importation.

A LARGE ORDER FOR SEED POTATOS.—The Duchess of Marlborough's committee have instructed Messrs. T. McKenzie & Sons, 34, Dawson Street, Dublin, to supply 1200 tons of Scotch Champion Potatos, to be distributed amongst the distressed and suffering tenantry of the West of Ireland. *Gardeners' Record.*

by Adolphus Burgess, of East New York, 1865), a hybrid between Queen of the Prairies and Madame Laffay (Remontant); rosy-crimson, occasionally blotched with white. Jane, rosy-blush, double and finely shaped. King of the Prairies (Samuel Feast, 1843), pale rose. Gracilis (W. Prince, 1845), rose, varying in hue. Linnaean Hill Beauty, white or pale blush. Madame Caradori Allan (S. Feast, 1843), bright pink, semi-double. Milledgeville, pale blush, tinged with flesh. Miss Gunnell, pale pink. Mrs. Hovey (Joshua Pierce, of Washington), pale blush flowers, becoming almost white; resembles Baltimore Belle, but of rather hardier habit. Mrs. Pierce (J. Pierce, 1850), blush. Pallida (S. Feast, 1843), blush, much resembling Superba. Perpetual Pink (S. Feast, 1843), rosy-purple. Pride of Washington, deep rose; small flowers, but distinct and double. Queen of the Prairies (S. Feast, 1843), bright rosy-red, frequently with white stripe; foliage large and quite deeply serrated. Ranunculiflora, small, blush flowers. Superba (S. Feast, 1843), pale rose, changing to blush. Triumphant (J. Pierce, 1850), deep rose, double and compact. There have been a few other varieties in commerce, but the above constitute those which have most commonly been grown, and are the only ones now propagated. The most valuable are—Anna Maria, Baltimore Belle, Gem of Prairies, Mrs. Hovey, Queen of Prairies, and Triumphant.

#### NOISETTE, OR CHAMPNEY ROSES.

Rosa Noisettiana, or Rosa Champneyana, or Rosa moschata hybrida. The Noisette Rose is a product of America, and obtains its name from Philippe Noisette, a florist of Charleston, South Carolina. John Champney, of Charleston, from the seeds of the White Musk Rose, fertilised by the Blush China, raised a variety which was called Champney's Pink Cluster. A few years after this, Philippe Noisette, from the seed of Champney's Pink Cluster, raised the Blush Noisette, and this he sent to his brother, Louis Noisette, of Paris, under the name of Noisette Rose. The true name, therefore, for this class should be the Champney, but the change cannot now be made. This group is naturally of vigorous growth, nearly hardy, and produces large clusters of flowers; but, through hybridisation with the Tea section, the original characteristics have in part disappeared.

The varieties now generally grown are less hardy, and have nearly lost the clustering tendency; but the flowers have much more substance, and are far more beautiful. America (Prof. C. G. Page, of Washington, D. C.; sent out by Thomas G. Ward, 1859); growth vigorous; flowers large, creamy-yellow, with a salmon tinge; a cross from Solferatte and Safrano. Beauty of Greenmount (James Pentland, of Baltimore, 1854), rosy-red. Champney's Pink Cluster (John Champney), very vigorous; flowers pink, semi-double. Cinderella (C. G. Page, 1859), rosy-crimson. Dr. Kane (Pentland, 1856), growth free; flowers large, sulphur-yellow; a shy bloomer on young plants; in the South it is highly esteemed. Isabella Gray (Andrew Gray, of Charleston, South Carolina, 1854), growth free; flowers large, golden-yellow, full and fragrant; on young plants it does not flower fully, and often opens badly; a seedling from Cloth of Gold. Nasalina (A. Cook, 1872), "of vigorous growth; flowers pink, of flat form, very fragrant; a seedling from Desprez." Tusneltea (Anthony Cook, of Baltimore, 1860), "pale yellow; a seedling from Solferatte." Woodland Marguerite (J. Pentland, 1859) growth vigorous; flowers pure white, freely produced. There have been other American varieties of this class, but I am only certain of those above named. We hope our Southern rosarians will introduce some new types and colours of Noisettes; almost the only ones of value we now have are shades of yellow and white. In the South many Noisettes seed freely, and great improvements might easily be made by resorting to manual fecundation. I see nothing to prevent the obtaining of the same shades among the Noisettes that we have among the Hybrid Perpetuals.

#### BOURBON ROSES.

Charles Getz (A. Cook, 1871), a hybrid; "growth very vigorous, making a good climber; quite hardy; colour deep pink; very fragrant." George Peabody (J. Pentland, 1857), growth moderate, colour purplish-crimson; a probable seedling from Paul Joseph. Oplitz (A. Cook, 1871), "a hybrid; growth moderate, colour fiery red; a seedling from Gloirie des Rosomenes." Renno (A. Cook, 1868), named after General

Renno, of Philadelphia; colour deep pink. Setina (Peter Henderson, 1850), identical with Hemmosa, from which it is a sport, except that it is of stronger growth.

#### BENGAL ROSE.

James Sprunt (Rev. James M. Sprunt, 1856), sent out by Peter Henderson, 1870; like Cramoisie Supérieur, but of vigorous growth, making an excellent climbing sort.

#### HYBRID PERPETUAL ROSES.

Belle Americaine (Daniel Boll, of New York), deep pink colour; flowers small, but of fine form. Madame Boll (Daniel Boll), sent out by M. Boyeau of Angers, France, in 1859; growth vigorous; foliage very large and handsome, of a pale green colour; spines numerous; flowers large or very large, form flat, colour carmine-rose; a free autumnal bloomer and very hardy—perhaps the most hardy in the class. One of the most superb Roses for the garden. Madame Trudeau (Daniel Boll, 1850), deep rose, double and well formed. Charles Cook (A. Cook, 1871), scarlet-crimson. Contina (A. Cook, 1871), rosy-pink. Il Defense (A. Cook, 1871), shining red, Camellia form, thornless. La Brillante (A. Cook, 1872), brilliant red; raised from Napoleon III. Rosalina (A. Cook, 1871), rose colour. Souvenir de President Lincoln (A. Cook, 1869), dark velvety crimson. These are the only varieties I can name of American origin, though others have been raised. Mr. Boll, now deceased, who was by birth a Swiss, produced a number of seedling Hybrid Perpetuals of merit; several of these were sold to parties in France, who sent them out as their own. Among these was Madame Boll. It would be interesting to know, whether any among them besides Madame Boll are now famous.

#### TEA ROSES.

American Banner (George Cartwright, of Dedham, Mass., 1877), sent out by Peter Henderson in 1878; a sport from Bon Silene; growth moderate, foliage quite small and leathery; flowers carmine, striped with white. The form and fragrance of the flowers seem the same as in the old variety, but in habit they are entirely distinct. It will perhaps be popular as a novelty, but it has no intrinsic merit to make it valuable, and we cannot commend it. Caroline Cook (Anthony Cook, 1871), colour pink; a seedling from Safrano. Cornelia Cook (A. Cook, 1855), growth moderate, flowers white tinged with flesh, large and very full; not a free bloomer, and often does not open well, but a superb Rose when well grown; a seedling from Devoniensis. Desantres (A. Cook, 1855), "colour flesh, very distinct from any other Tea Rose; a better bloomer than Cornelia Cook, and a good winter flower. Raised from Devoniensis." General Washington (C. G. Page, 1860), rosy-crimson. Isabella Sprunt (Rev. James M. Sprunt, 1855), sent out by Isaac Buchanan, of New York, in 1865; sulphur-yellow, a sport from Safrano, which variety it very closely resembles in all save colour of the flower. Paradine (A. Cook, 1858), canary-yellow small flowers; a seedling from Le Pactole. President (sent out by Mr. W. Paul, of London, in 1860), growth moderate; colour rose, with salmon shade; flowers large, moderately full, much resembling Adam. Mr. Paul, the disseminator, states that this is an American variety, but I am unable to learn by whom it was originated.

Among the many letters I received in response to inquiries is one from the Rev. James M. Sprunt, D.D., and it is of such interest that I insert it as it came to me;—

"Jan. 1, 1880.

"In the spring of 1855 I removed from my former residence in this town (Kenansville, N.C.), to the premises on which I now reside. Among the plants which I carried with me was a very large and handsome Safrano Rose. It had been trained to a single stem, fully 2 inches in diameter, and forming a symmetrical head about 4 feet from the ground. I pruned it well back, but the early summer being dry, the top died. The plant, however, put forth six or eight strong shoots from the collar at the surface of the soil, and one of these attracted my attention from its dissimilarity to the others in the colour of the stem and foliage. I observed it carefully until it bloomed, when it proved to be a fine yellow, all the other shoots retaining the normal colour of the Safrano. From this sport, which was named Isabella Sprunt, from one of my daughters, I sent cuttings to Mr. Isaac Buchanan, florist, of New York, in 1860, and it was sent out by him some two or three years afterwards, I think before the close of the war,

though I heard nothing concerning it till 1865. (By referring to old files of the *Country Gentleman*, we find Mr. Buchanan first offered this for sale in 1865.)

"I may add that in the winter of 1856 I took up the old plant, and sawed the stock into five or six pieces, being careful to get a good share of the root to the yellow shoot; that plant still lives, and is quite constant though it has had, perhaps, two or three Safrano flowers, certainly one, and besides, about two years ago there was a fully developed bud and flower exactly one-half of which was like Safrano and the other half like Isabella Sprunt. I tried to fix this new sport, but it produced afterwards only yellow flowers.

"About the same time (1855) I divided some strong plants of Agrippina, and planted them at my new home. Two or three years later I observed a single shoot from one of these plants growing vigorously without flowers or branches, and as I observed it from time to time, it continued until it measured over 15 feet before it showed any buds, the rest of the plant retaining its normal characteristics. This shoot branched out very freely the following year, and cuttings retained the same habit invariably. I came to the conclusion that this was not a sport, but a chance seedling, as the flowers were so very unlike the parent, and the roots were so matted together that I could not determine whether it proceeded from the old root or not, without taking up the whole plant, which I was unwilling to do. But the wonderful thing is, that after the rest of the plant had for years retained its original habit and flowers, gradually it began to change, until the whole is now like the James Sprunt in growth and flower, and no part of the Agrippina remains. I have written you this statement that you may judge for yourself, my own opinion having changed more than once. *James M. Sprunt.*"

Safrano is, therefore, without doubt, a sport resulting from one of these strange freaks in which Nature occasionally indulges. About James Sprunt there is less certainty, but I consider it also to be a sport; it is like Agrippina, only with more substance of flower and greater vigour of growth. The theory of evolution would point towards this, as an example of how Nature tends towards progression and improvement as well as towards variation.

#### SURFACE DRESSINGS FOR CONIFERS.

I QUITE agree with the practice of applying heavy surface-dressings with a view to the prevention of the uprooting of valuable Coniferous trees, having followed it up more or less for many years wherever practicable, which is not always the case under the old style of planting, which in dressed grounds was almost invariably too deep, in order that the surface of the lawns (and Arboretums where kept constantly mown) might be uniform.

It is under such circumstances that the plan recommended by Mr. Rust (p. 215), of placing a circular erection of stones or bricks to keep the soil at a distance from the collar of the tree becomes valuable, and is indeed the only plan available in cases where surface-dressing becomes an absolute necessity, but where the ground is either quite level or the inclination towards instead of from the collar of the tree. At the same time, by way of caution, it must be observed that an indiscriminate quantity of earth must by no means be placed over the roots at one application, as in most instances it would be more likely to be injurious than beneficial, and the cases in which it would be least likely to be hurtful would be those in which the trees are standing considerably above the general level. A few years ago we had, in the course of some alterations, to fill up a rather wide and deep hollow, on the upper edge of which grew a fine luxuriant Spanish Chestnut, probably nearly 100 years of age; the hollow was only filled so as to bring the surface up to the general level, so that more than one-half of the surface was not interfered with at all, and yet the second year afterwards this tree was completely dead, and we could assign no other cause than the quantity of soil heaped upon the roots on one side.

When we consider that in dressed grounds the scythe, the mowing-machine, and the broom are constantly depriving the trees of all that nourishment, consisting of fallen leaves, the fibrous loam resulting from the decay of the roots of grasses, commingled with worm casts, which the trees enjoy under more natural conditions, we may reasonably conclude that if the trees are to be maintained in vigour, applications of earth to the surface will become an absolute necessity in after years; and this consideration ought to be

borne in mind and materially influence the operations of planting for specimen trees in dressed grounds, where they should be raised so much above the general level that such applications of earth to the surface may be made without materially altering the contour of the ground, or interfering with the collar.

At the same time planting on small mounds should be equally avoided, as they are both ugly and unmeaning; and it is quite possible to raise the collar of the tree, say 2 feet above the general level, and so to arrange the inclination of the ground from that height that it may lose itself gradually in a natural manner, and thus all appearance of a mound may be avoided: and this becomes the more necessary to be attended to at the first, because as a general rule it will be some years before the trees will attain the age and size when surface applications become a necessity.

The same precautions with regard to planting trees intended to make specimens on elevated sites should be observed when planting in woods or any other situations where the surface is never disturbed, and where the trees are therefore not deprived of the restorative surface-dressings supplied in a natural way, because even here the trees are greatly benefited by having occasional cartloads of road-side scrapings or other composts spread over the surface.

In these latter situations the planting in the first instance may be performed without the aid of any extra compost and with great advantage as regards rapid extension and the future well doing of the trees, by allotting a large and open space of ground, either naturally or artificially well drained, to each tree. Commence to dig from the centre, and, gradually working round it, throw up a mound to the requisite height above the ground level; and on this mound, after pressing it down moderately firm, place the roots well spread out, and then cover them by digging out the outer circle and throwing the earth over, and so forming the slope that at the last there shall be an open trench at least 18 inches below the ground level. If there are trees in the neighbourhood the roots of which are likely to encroach on the mound, the precaution should be taken to turn over the bottom of that trench at least another foot; the trees will thus be isolated for a year or two, and will have a fair chance of becoming established, when the trench may be filled with compost, and surface-dressings applied from time to time in after years.

The benefit to be derived from superficial applications of fresh material is by no means confined to Coniferous trees, or indeed to trees at all. It will be found highly beneficial in many other of our most important operations, and if considered desirable I propose to resume the subject in a future paper. *John Cox, Redleaf.* [Please do so. EDS.]

## THE BEDDING-OUT SYSTEM.

THE opponents and the advocates of this practice are as one in their condemnation of the abuse of the system. But this does not by any means settle the question, as it would appear that the former altogether object to the annual turning out of tender plants into the beds of the flower garden and elsewhere, and contend, I believe, that such beds and borders might be better furnished by our numerous species of hardy plants, which would at all seasons of the year be objects of interest, and some of which would be in bloom at nearly all seasons. The truth of the latter part of this assertion no one will attempt to deny. The relief this would afford to the flower gardener would doubtless be very considerable, as the annual turning of some thousands of tender plants out of pots into the beds and borders of the flower garden necessitates considerable expense, and their propagation and preparation for this purpose demands much forethought and a great amount of labour—a labour of love, I will admit, in many instances, but a very considerable labour nevertheless.

But the question now to be considered is this—Would the proprietors of flower gardens, or would the general public, be satisfied with this state of matters? I fear not. Our hardy alpine and spring flowering plants are exceedingly interesting, and many of them are very pretty, and everybody loves and admires them, but unfortunately the state of the weather in this country at the time they are in their greatest beauty is too often such as to prevent people spending much of their time in their gardens; and it might, I fear, be truly said that “many a flower was

born to blush unseen, and waste its sweetness in the desert air.”

Many of our summer and autumn flowering hardy herbaceous plants and annuals are effective enough while they remain in bloom, but in most cases the blooming season of such plants is of short duration, and it is difficult to induce even a few species to keep each other company in this respect. And, taken altogether, it is hardly possible to maintain a simultaneous and continuous display of flowering plants for, say, five months of the year, by the exclusive use of hardy plants. Now, on the other hand, it is found that there are various species of exotics, or what are known as tender plants, that is, plants which are not sufficiently hardy to withstand the rigours of our winters, but which are found to succeed admirably in the open air in this country during the summer. So that it really does not seem very wrong nor greatly opposed to what may be considered as the rules of good taste, to make use of these accommodating plants to assist in producing a display for so considerable a portion of the year.

In some instances, perhaps I ought to say in many instances, undue advantage has been taken of the glowing or warm colours of the flowers of some of these plants, in producing what is considered a glaring effect, and this, it would unfortunately appear, has produced upon the sensitive nerves of some persons of very refined tastes something which may perhaps be defined as scarlet-geraniophobia. This is certainly very much to be regretted, and it is now confidently hoped that much of this will be rectified, and as a natural consequence “bedding out” will become still more popular than it has ever been, for the simple reason of its being better done than formerly. Much of this desired improvement will and has already been effected by the judicious use of suitable plants bearing flowers of neutral shades of colour, as well as by the use of plants (hardy as well as tender) with ornamental foliage, &c. Without, however, by any means altogether discarding our bright coloured friends, which during such cold and dripping summers as we have of late experienced have been acceptable rather than otherwise, I think the flower gardener can hardly be accused of showing any reluctance to the introduction of hardy plants into the parterre, but is on the contrary very glad to do so, when such can be found to suit his purpose. He is, moreover, not one who would hang a dog on account of his colour, nor ignore a suitable plant because of its blooms being intensely bright, or even glaring, but will rather endeavour to neutralise or subdue this effect by the use of flowers or foliage of more sombre character.

I have never been quite able to understand why an architectural or geometrical flower garden should be considered in any degree as an objectionable or inapplicable adjunct to a modern mansion. There may, it is true, be residences which fortunately command fine and extensive views of the surrounding country, where beds of flowering plants in its immediate vicinity might be considered as an intrusion, and as tending to divert attention from the more extended beauties of the landscape; but in all such cases other sites than that of the immediate vicinity of the mansion are generally available for that of the flower garden. Another, and an often adduced objection to a summer flower garden, more particularly when in contact with a residence, is the desolate appearance of the beds during the winter months; in most cases, however, this is now effectually remedied by the judicious use of small plants of our many hardy ornamental evergreen shrubs and Conifers, &c.

Very much has of late been written in praise of what has been termed the wild garden, or wilderness, and there are few who fail to admire the beauty of our native plants in their normal or wild condition, notwithstanding that this generally exhibits a fierce struggle for existence, in which the strongest if not the fittest usually prevail—such as a group of yellow Primroses or blue Violets in possession of a mossy bank, but likely to be soon overrun and smothered by fierce Brambles or rampant Dog Roses, unless the wild gardener in such cases steps in and interferes, by establishing a “scientific frontier,” which some might condemn, and prefer to leave the children of the wild woods to fight their own battles. But however great the charms of the wild garden may be, its tangled and rampant beauties should certainly be kept at considerable distance from a mansion or residence, where its too close

proximity could only indicate either slovenliness or affectation.

Variety, however, is confessed to be charming, and there is no reason why an extensive garden establishment should not comprise a variety of gardens, such as a winter garden, which in this country can only exist under the protection of glass and in an artificial atmosphere—and in most establishments this desideratum exists in the form of a conservatory or greenhouse; also a summer flower garden, a spring flower garden, a hardy Fern garden, and a wild garden, together with a fruit garden and vegetable garden, all occupying to some extent separate sites, while at the same time each should form part of a comprehensive and harmonious whole. *P. Grieve.*

## THE FROST OF DECEMBER,

1879.

AT the usual monthly meeting of the Meteorological Society, held on Wednesday evening, the 18th inst., Mr. G. J. Symons, F.R.S., President, in the chair, Mr. W. Marriott, F.M.S., read a paper “On the Frost of December, 1879, over the British Isles.”

Exceptionally low temperatures were registered all over the British Isles from December 1 to December 7. On December 1 the lowest temperature was  $-2^{\circ}$ , at Ketton, near Stafford; and the next lowest was  $-5^{\circ}$ , at Trent College. The temperature continued low throughout the day, at several places not rising above the freezing point. On the 2d the cold was more intense. In the counties of Leicester, Lincoln, and Nottingham the temperature fell below zero, the lowest being  $-4.5^{\circ}$ , at Coston, near Melton Mowbray. Temperatures between  $0^{\circ}$  and  $-10^{\circ}$  were registered in the north and south of Scotland and along the central part of the north of England to the Midland and Eastern Counties, while over the whole of England, Scotland, and Ireland, with the exception of the sea-coast stations, the temperature fell below  $-20^{\circ}$ . On the 3d the temperature was more evenly distributed and not quite so intense as on the previous day; however, in the North Riding of Yorkshire and the Valley of the Tees, readings at and below zero were registered, the lowest being  $-2^{\circ}$ , at Gainford.

On the 4th intensely cold weather was experienced over the south of Scotland and the north of England: the lowest reading obtained was  $-23^{\circ}$  at Blackadder in Berwickshire;  $-16^{\circ}$  was also registered at Springwood Park, near Kelso; and readings of  $-5^{\circ}$  were reported at Haddington, Melrose, and Corbridge-on-Tyne; and  $-4^{\circ}$  at Alston. Temperatures below  $10^{\circ}$  were registered over the south and south-east of Scotland, and over the north of England as far as the valley of the Trent, and also in the Eastern Counties; while over almost the whole of England, Scotland, and Ireland the temperature fell below  $20^{\circ}$ . In some parts of the south of Scotland and the Border Counties the maximum temperature during the day did not rise to  $20^{\circ}$ . On the 5th the minimum temperature was not so low as on the previous day, there being a cloudy sky and a general fall of snow. In Ireland, however, this was the coldest day of the month. On the 6th the temperature fell considerably in Derbyshire, Nottinghamshire, and Yorkshire: readings of  $-3^{\circ}$  being recorded at Trent,  $-1^{\circ}$  at Buxton, and  $0^{\circ}$  at York and Stanley.

At many places the maximum temperature during the day was much below the freezing point. On the 7th very low temperatures were registered over the whole of the north and east of England; the lowest reported was  $-10^{\circ}$  at Ketton, near Stamford. The temperature fell below zero in the counties of Essex, Leicester, Derby, Lincoln, Nottingham, and York, and also in the south of Scotland; while over almost the whole of the north-east and central part of England, as well as a portion of the south-east district, the temperature fell to  $10^{\circ}$  or below. Readings below  $20^{\circ}$  prevailed over nearly the whole of England and Scotland, and the centre of Ireland. The maximum temperature during the day at a few places was extremely low, the thermometer at Appleby only recording  $12.4^{\circ}$ , and that at York  $18^{\circ}$ . During the next few days a little warmer weather prevailed, but on the 11th the temperature fell below  $20^{\circ}$  over the central part of England, Scotland, and Ireland. Low temperatures were also experienced at most places on the 12th. Milder weather continued for the next few days, but on the 17th the temperature again fell below  $20^{\circ}$  over the whole of the south of England. Low temperatures also prevailed on the

18th, 21st, 23d, 24th, and 26th, while the maximum temperatures at many places on the 21st and 26th did not reach 32°. At almost all the inland stations frost occurred on an average of about twenty-five days during the month, and temperatures below 20° were registered from eight to thirteen days at several places. The only station where frost was not felt was Scilly, the lowest temperature recorded there being 33° on the 2d.

The only comparatively mild districts were the west and south of Ireland, and the extreme south-west of England. Even the seaside health resorts, which are reputed for their mild climates, were not exempt from the cold, the temperature falling below the freezing point on eleven occasions at Ventnor, fifteen at Torquay, twenty at Sidmouth and Eastbourne, and twenty-four at Ramsgate and Worthing. During the time of the cold weather the barometer was very high over these islands, and an anti-cyclone was formed over those districts where the lowest temperatures were recorded. That the cold was the result chiefly of radiation is shown by the great difference in temperature at the hill and valley stations. For instance, at Farley, 640 feet above sea level, 17°.7 was registered on the 9th, while at Oakmoor, 300 feet lower, in the valley of the Churnet, and less than a mile distant from Farley, the temperature fell to 1°.1. The effect of the cold upon the health of the community was very great. In London the number of deaths referred to diseases of the respiratory organs increased to 799 in the week ending December 20, and exceeded the weekly average by 288. The public journals record the fact that several persons were frozen to death in various parts of the country. The frost also caused great injury to plants, shrubs, and birds.

### KELLY,

THE seat of Dr. Young, is situated on the south bank of the River Clyde, in the parish of Inverkip, and some 30 miles south-west of Glasgow. Kelly House is of large dimensions, and its external appearance plain but neat. Dr. Young has lately added a large picture gallery to its south end, which he has filled with a grand collection of pictures by the best masters. The pleasure-grounds are entered by a very neat gate and lodge. They are extensive and very tastefully laid out, as well as remarkably well kept, and all the surroundings are rich and attractive. The coast at this place is bounded at a short distance back from the shore by a range of hills, rising at some places in gentle slopes, and at others in abrupt rocky precipices. In this neighbourhood stand Skelmorlie Castle, Knock Castle, Routenburn, and Fairlie Castle, and among these Kelly stands pre-eminent as one of the most beautifully situated.

Here also is perched on the edge of a precipitous rock near to the sea, the celebrated Skelmorlie hydropathic establishment, one of the most comfortable in the West of Scotland. Its situation affords to its numerous visitors the most bracing air, and views of some of the grandest scenery which the Firth of Clyde affords, and, as it is put (pardon the Hibernianism), the luxury can be enjoyed at all times of salt water fresh from the sea. Through the kindness of Dr. Young visitors to the above establishment or others residing in the district may obtain (by written application) cards admitting them to walk through the grounds and Kelly Glen every day (Sunday excepted). Those cards are available for the whole season. This act of kindness on the part of Dr. Young is a great source of pleasure to the numerous visitors to the district, and is largely taken advantage of, as the walks through the glen are the most delightful in the district, and the banks on either side are one mass of spring flowering bulbs, &c., of nearly 10 acres in extent. At the top of the glen and just below the garden is a very neat summerhouse, very tastefully got up. It is covered with moss having shells wrought in, forming the Rose and Shamrock pattern.

The neighbourhood was notorious for its witches early in the last century. People of peculiar habits were objects of suspicion. Surprise has been expressed that many of those unhappy persons should have confessed themselves guilty of this crime, but it must be remembered that many of them were examined under torture—thrusting pins into the flesh, and keeping the accused from sleep being the ordinary treatment of a supposed witch. The following traditional

rhyme of the district relates to Alexander of Dunrod, who was supposed to be a warlock. It may be observed that the custom in Scotland, in days long gone by, was, and even still is in some parts, to name a person after his place of residence.

"In Inverkip the witches ride thick,  
And in Dunrod they dwell;  
But the greatest loon among them a'  
Was auld Dunrod himself."

"Auld Dunrod was a goustie carle  
As ever ye might see,  
And gin he was in a warlock wicht,  
There was nae in the haill countrie."

"Auld Dunrod stuck in a pin—  
A bourtree pin—in the wa';  
And when he wanted his neighbours' milk,  
He juist gied the pin a throw."

"He milkit the Laird o' Kelly's kye,  
And a' the kye in Dumoon;  
And auld Dunrod gat far mair milk  
Than would mak' a gabbart\* soum."

Tradition also has it, that if a witch, or warlock, drew a hair rope across the mouth of a jug, they could draw the milk from all the cows in the district by an unseen hand. I have to thank the author of the *Guide to Wemyss Bay, &c.*, for the following regarding Livingstone, and other interesting facts connected with the district. Dr. Young, being one of Dr. Livingstone's early friends, fitted out, at his own expense, an expedition for his recovery. After Dr. Livingstone's death, the two Africans, Susi and Chuma, who had so faithfully attended their master till the last, and who brought home his remains, resided for some time in this country, and during the summer of 1875 spent a fortnight at Kelly, and at Dr. Young's request they erected a fac-simile of the hut in which Dr. Livingstone died (see fig. 49), in the grounds at Kelly. It is erected about 50 yards from the north-west corner of the kitchen garden, on a grassy slope. In front are some very fine specimens of Conifere, such as *Piceas magnifica* and *cephalonica*, *Wellingtonia gigantea*, &c. It may be here mentioned that Dr. Young acquired his Doctor's degree for his high professional skill as a chemist, and for having been the first to discover that paraffin oil could be distilled from shale. From the hut is a gate in the wall, opening on a walk leading to an eminence, where is erected a very large and handsome summer house. From this point most extensive and varied views are obtained. Looking east, the eye takes in Ben Lomond and the mountains all about Loch Eck, and on towards Inverary. To the west the Cowal Hills are seen in all their extent, with the sea between. On their southern slope are the pretty watering towns of Inellan, Dunoon, and Kilcreggan, and to the south-west is descried the Kyles of Bute and all about Rothesay, with the lofty mountains of Arran in the far distance. Goatfell, the highest in the range, rises to a height of 2866 feet. Looking nearly due south is seen, standing in mid-ocean, that wonderful mass of rock, Ailsa Craig, and about 6 miles off the thriving town of Largs, with its beautiful surroundings. Here was the scene of the famous battle, known in history as the battle of Largs, between the Norwegians under King Haco, and the Scots under Alexander III., fought on October 3, 1263, which ended in the complete overthrow of the Norwegians, and freed the country from their invasions; and about 2 miles to the south stands Asheraig, the seat of the Misses Stewart, a place long noted for its fine situation, and the high order in which everything about it is kept.

The conservatory here is a very handsome iron erection in the curvilinear style, 80 feet in length, 27 feet wide, and 16 feet high, and contains many rare and well-managed plants. The following are very conspicuous, and are in a wonderful state of health:—*Camellias*, Old White, a bush-shaped plant, 8 feet high and 18 feet in circumference; *Donkelaarii*, a pyramid, 6 feet high and 12 feet round; *Myrtifolia*, 6 feet high and 12 feet round; two *Lady Hume's Blush*, 6½ feet high and 13 feet round; two *Carswelliana*, pyramids, 10 feet high and 12 feet round; *Melrosei*, a variety raised in this district, 7½ feet high and 14 feet round; tricolor, 8 feet high, and 14 feet round; two *Dicksonia antarctica*, stems 6 feet high, spread of tops 12 feet; *Alsophila australis*, stem 3 feet, spread of top 14 feet; two *Oranges*, 7½ feet high, and 18 feet round: the crop

\* A flat-bottomed boat.

and health of these is extraordinary; *Corypha australis*, 7 feet high and 9 feet through; *Cordylina indivisa* and *Banksii*.

Suspended from the roof are very handsome hanging baskets filled with the most approved plants for the purpose. There is a very handsome fountain at the west end, and here also are placed large mirrors, which reflect the greater part of the house. The north end is taken up with a rockery, very artistically done, with neat miniature waterfalls. In it I found very healthy specimens of *Alantium Flemingii*, *gracillimum* and *farleyense*, *Gleichenias*, *Aspleniums*, &c. Here were also two *Dicksoaia antarctica*, with stems 9 feet high, and a grand pyramidal plant of the old white *Azalea*, 6 feet high and 11 feet round. Vinery No. 1 is 40 feet long, 12½ feet wide, and 16 feet high. The Vines are chiefly Black Hamburg. It is used as an early house, and had an excellent crop all over the house. An old Peach tree in this house deserves notice on account of its remarkably free bearing qualities in such a situation. No. 2 is a Hamburg-house, 22 feet long, and of the same width and height as the first, with the roots outside and in. No. 3 is similar to No. 1. No. 4 is in the shape of a half circle, and planted with Vines brought by Dr. Young from the Vale of Eschol. They have not fruited as yet, but are very coarse growers, and the wood is difficult to ripen. In this house I found some very pretty Orange plants, in a small state, nicely fruited, raised from seed gathered by Dr. Young from St. Gerome's tree at the convent, Bethlehem. No. 5 is an early Peach-house, 30 feet long, 11 feet wide, and 12 feet high; the trees young and very healthy. No. 6 is a vinery of the same dimensions as No. 5, full of young Vines, to be used as an early house. The back wall is to be planted with Figs brought by Dr. Young from Mount Olivet. No. 7 Peach-house is of the same dimensions as the two last; very fine trees, and excellent crops are obtained. Here there is a fine range of pits principally used for growing Strawberries in spring—*Garibaldi* and *President* being the varieties used, and over 1000 pots are forced every season. There is also a span-roofed stove, 52 feet long and 12 feet wide, filled with a very fine collection of plants, in a small state, as they are principally used for table decoration, including a very nice healthy collection of Orchids. The roof on both sides is covered by a large plant of *Stephanotis floribunda*, which flowers most abundantly.

The kitchen garden is nearly 4 acres in extent, in three divisions of terraces, and slopes gently to the south. It is so nicely arranged on all sides, by judicious planting of shrubs and otherwise, that but little of the kitchen garden proper is seen in walking round. Pyramidal fruit trees are rather largely planted out here, but as a rule fruit trees do not bear well, the atmosphere being too humid in autumn for them to ripen their wood. All sorts of bush fruits are had in abundance. In front of the conservatory, running its whole length, there is a ribbon-border, 16 feet wide, filled with bedding plants; and facing this, between the conservatory and kitchen garden, is a large space of short grass, intersected by gravel walks. At the top of the kitchen garden is a gravel walk, 7 feet wide, which runs the whole width of the garden, and on the south side of this is a broad border, filled with choice *Rhododendrons*, pyramidal *Hollies* (mostly *Queen*), and other fine shrubs. To the back of this is a row of *Fuchsia Kiccartoni* and *Tritoma Uvaria*, planted alternately, backed with a hedge of *Escallonia macrantha* and standard *Rose Gloire de Dijon*, also planted alternately 6 feet apart. The front of this broad border facing the conservatory is all bedded out with the most effective bedding plants, which gives the place a very gay appearance in summer. *Violas* are largely used here, as the soil and climate suits them well, and a good show of flower is had from them for eight months in the year. The outhouses, bothies, &c., are most complete. The gardener's house stands at the south-east corner of the garden, on a rather high elevation. It is two storeys high, and for comfort and convenience is just what a gardener's house ought to be. Mr. Machray, Dr. Young's head gardener here, has long been known as an ardent horticulturist, and the plants and trees under his care afford abundant evidence of his skill and ability. *John Downie*.

THE DOG ROSE.—The following I take from the *Star*, May 13, 1794:—"On the road to Edgeware the husbandman's sign of an early and plentiful harvest is seen adorning the hedgerows, with the blossoms of what is commonly called the Dog Rose. This wild flower affords the farmer the means of calculating the time of harvest: as early as it appears before Midsummer, so long before Michaelmas he computes the time of reaping. We may therefore expect the next harvest will begin early in August." *A. F. G.*, in "*Notes and Queries*."

Forestry.

PREPARATIONS FOR PLANTING.—There is much truth in the proverb, "Well begun is half done." It need not here be discussed whether this is literally true or not; but one thing is certain, that every false step and wrong action taken in respect to planting is less than no advancement or progress made. The first thing to do—or, at least, among the first—is to resolve upon a subject, or piece of ground to plant, and always the sooner this is done the better. Anything done in haste in connection with planting is usually imperfectly done, or at least less perfectly executed than if time and thought had been duly bestowed upon it.

As soon as a piece of ground is fixed upon for planting, the forester should take every available means and opportunity of knowing all that can be known about it. By this I do not infer that

the proprietor for the outlay of his capital—it is not usual that any single plantation is expected or intended to fulfil all these requirements, but even considerably short of that—it must be self-evident that, in order to plant with any degree of certainty, much forethought and consideration is required, and also no small experience.

The form and outline of a plantation is a matter for wise consideration; and not only the boundary line, and appearance when young, it must also be looked at through the vista of the coming years, and in its state of maturity. The plantation has also to be looked at prospectively in connection with other plantations and surrounding objects, such as hills, rocks, lakes, and rivers. Plantations, too, should bear a due proportion to the general features and objects of the surrounding landscape. Large areas of plantation in the midst of small arable fields do not look well; neither, on the other hand, do small

signed to be grown. There are many useful belts of not more than 1 chain wide, but the trees in such are necessarily either bushy and of stunted growth, or weak, small and slender, and short-lived. Where the planting is primarily designed to please and gratify the taste, and where the object is viewed from various standpoints, it is wise and judicious to set up as many artificial trees as fairly to represent the plantation, or single trees after being planted and so far grown up. Thinnings of Scotch Pine or Spruce do well for the purpose, and give those who have had but limited experience of such work a better guide than can be given in any other form. Taste in regard to plantations varies, as it does in other things. Bygone generations planted chiefly in rows and straight lines, and now nothing will please but bends and curves. I know of no standard or rule for the one system more than the other; and, indeed, if our ancestors erred in the direction of straight lines, we

FIG. 49.—FAC-SIMILE OF THE HUT IN WHICH LIVINGSTONE DIED, ERECTED BY SUSI AND CHUMA IN DR. YOUNG'S GARDEN AT KELLY. (SEE P. 268.)

any man is capable of knowing everything that is desirable to be known, but only to put himself in possession of as much knowledge regarding the subject as he possibly can. We probably learn more from our mistakes and failures than we do from certainties and successes. At whatever time of the year a forester enters upon the duties of a new situation, he is much the better for waiting a complete round of the seasons before doing much either in planting or thinning. The climate requires close and due consideration; the soil must be well studied; the natural enemies, whether quadrupeds or insects, should be carefully considered, together with the elements at all seasons. To learn and understand the power and influences of all that surrounds us is more difficult by far than to read books and listen to human instructions, however clear and well defined. As the object in planting is usually manifold—such as affording shelter to crops and farm stock, providing covert for game and rendezvous for the fox, embellishing and beautifying the landscape, ameliorating the climate, together with supplying the district with wood and timber, and remunerating

patches and narrow belts look elegant amongst broad and extensive fields. The north and east sides of fields and steadings, and also cottages, gardens, &c., should be sheltered and well protected from the storm, tempest, and cold winds; while, on the other hand, the south always, and generally also the west, should be left open and exposed. Nothing of a rural kind is less in keeping with good taste and propriety than for a farm steading, or cottage, to be surrounded with trees, in close proximity to the house on the south and west sides, while the north and east sides are bare and exposed.

The breadth of the various descriptions of plantations is also a subject of no small importance, and deserves much thought and consideration. No fixed rule can be laid down applicable to all cases, but if an error is to be committed, let it be that of planting too broad rather than too narrow belts. Indeed, unless the ground is too valuable to plant, or where the fields are small, no shelter-belt should be of less breadth than 3 chains. This ought to be regarded as the minimum breadth where useful timber is de-

possibly transgress in some cases in regard to curves; and it is, I think, a question that may very justly be asked, Why so fastidious as to the curves and circles in plantation fences, when we do not object to straight lines of railroads, rows of telegraph poles, turnpike roads, furrows and ridges in fields, wire and other fences, streets, rows of houses, and ribbon borders in our gardens, and in an infinity of other things? Practically it would be well to at least modify our passion for curvilinear outlines of plantations, seeing that the fences that now protect them are usually of wire, or such other as can only be practically and economically erected in straight lines, and not in regular curves. When the plantation is of large extent there need be no difficulty in forming it, if not of curves, at least of outlines equally efficient both to please the taste and answer all the practical requirements of curves.

The subjects of species of trees to plant, and how to arrange and dispose of them so as best to afford shelter and produce landscape effect, &c., must be deferred until another occasion. *C. Y. Michie, Cullen House, Banffshire, February 16.*

## Florists' Flowers.

**AURICULAS.**—These require strict attention during the ensuing month. Since they were surface-dressed the growth has been considerable, and with the new leaf-growth there is a corresponding root-action. Attention must be given to watering and ventilation; no plant ought really to feel the lack of water at the roots, and they will require an increasing quantity as the season advances. The drying winds during March are rather trying to the plants; they must be shaded from scorching sun, and the glass-lights should be tilted, so that cold winds cannot injure the plants. To prevent dust from blowing upon them, and also to cause a humid atmosphere, the ground round the frames should be sprinkled when it is dry. Small rooted offsets should be repotted into larger pots in the usual compost; they must not be over-potted, rather give a small shift now and repot again in May or June. A healthy rooted offset now will, if well managed, make a good flowering plant for next year. When the weather is mild and the air calm the lights may be drawn quite off. Seedlings must be pricked off as soon as the first leaf is formed after the seed-leaves; the plants are very small at that time, but it is necessary to prick them out as soon as possible, else many of them will die. Plants in houses or pits are more under the eye of the cultivator. The atmosphere should not be too dry; the plants must be as near as possible to the glass, and air be freely admitted, avoiding currents directly on the plants.

### CARNATIONS AND PICOTEEES.

The whole collection must be potted into their flowering-pots as soon as possible. The uncongenial weather that we have had in previous years warns us that it is advisable to shelter the plants in some way after they are potted. Mr. Dodwell prefers a screen of Haythorn's hexagon garden netting next to glass; this moderates the force of gales, and if it is tightly stretched over the plants at an angle rain is also thrown off. Of course it is much better if the plants can be placed under glass till they are established. The soil for potting should be sweet and moderately dry: four parts loam, one of rotten stable-manure and some leaf-mould and sand is a good compost. It is best to have this mixed two or three months before using it. Some growers, anxious to have plenty of room in which to layer the grass, over-pot their plants. This ought not to be done. Pot one plant in a 7 or 8-inch, two in a 9-inch, and three in a 10-inch pot; small plants and weakly growing varieties may even have small pots to flower in. See that any plants still in small pots do not suffer for want of water at the roots.

### DAHLIAS.

Cuttings should now be put in; I use a thumb-pot for each cutting. The pots are filled with fine soil, and a little sand is placed on the surface, the cutting is pressed gently round the base with the fingers. Plunge the pots in a gentle hotbed, the cuttings do not take long to form roots. About the end of next month pot roots should be taken into the forcing-house, where there is a gentle bottom-heat. Give the soil a thorough watering, and see that it does not become dry again. When the growths have started the soil should be partially shaken from the roots, and the plants may be potted into 4 or 5 inch pots. Seed may be sown this month if there is any convenience to pot off the young plants separately in small pots.

### GLADIOLI.

Those corms that were potted early in the year for early flowering should now be placed in cold frames where the lights can be removed to inure the plants to the weather, as they must be planted out about the end of the month in a sheltered place. The first lot of bulbs may be planted early in the month, and a few more at intervals of a fortnight; place some sand under and over the bulbs at the time of planting, and fill in the drills with fine loam. The small seedling bulbs should be planted in rows 5 or 6 inches apart, and about a foot between each row. These should also be encased in sand and treated in other respects like named varieties.

### HOLLYHOCKS.

Let all plants in small pots be potted on as they require it. Those early propagated should be shifted from the small 60's into 4 or 5-inch pots. The autumn propagated plants will now be strong, and

should be well exposed to the air, only placing the lights over them when frosty. The earliest plants must be planted out early in April; the late plants require to be more carefully nursed, to be planted out about the end of April. Seedlings may be planted out this month.

### PANSIES.

The whole of the plants ought to have been in their flowering pots last month, and they are now growing freely; if they are wanted to be in full flower by any particular date it is necessary to remove the flower-buds until within two or three weeks, or perhaps even four weeks from the time they are wanted—if the weather is warm two weeks would be sufficient. The lights should be quite removed from the frame in fine weather, and at all times plenty of air must be admitted. Plants in beds should have a rich surface-dressing, but before doing this fill up any vacancies from a reserve. If seedlings have been wintered in cold frames plant them out on a rich piece of ground.

### PINKS.

The beds should be mulched in the same way as the Pansy beds, pressing the dressing round the neck of the plants; some of them may even require the additional support of a stick to prevent the plants snapping over close to the surface of the ground. From the middle to the end of the month seed may be sown. A good plan is to sow in a box rather thinly, using three parts of loam to one of leaf-mould. The seed should just be covered with finely-sifted soil, and a square of glass may be placed over the box until the seeds vegetate; this they will do most quickly over a gentle hotbed, but if this is not available place the box out-of-doors.

### PHLOXES, PYRETHRUMS, &c.

Those planted in beds should now be attended to: let them receive a surface-dressing of rich soil, and any labels that are not likely to stand through the summer must be replaced with new ones. If the plants are more than three years old it is best to dig them up and replace with young ones.

### POLYANTHUSES.

Treat those in pots very much the same as the Auriculas. The opening flowers are not so easily injured as those of Auriculas, consequently it will not be necessary to cover up so closely for slight frosts; they require rather more water at the roots, but do not allow them to be exposed to rains at this time, as the foliage is not so beautiful after it has been dashed by rains.

### RANUNCULUSES.

Plant out at once if the ground is in good condition; the crowns of the tubers should be about 1½ inch under the surface of the ground. The rows may be about 5 inches apart. Seedling roots grow more freely than named sorts, and should be planted 6 inches apart each way. The surface of the beds should be slightly raised above the paths, but deep alleys do not look well.

### PLANTS IN COLD FRAMES.

Such plants as Aquilegias, Phloxes, species of Primula, Ixias, Sparaxis, &c., require no other attention except to air the frames freely, see that no insect pests attack the leaves, and give sufficient water to keep the soil in a moderately moist state. *J. Douglas, Loxford.*

## Garden Operations.

### KITCHEN GARDEN.

**BROCCOLI.**—In certain districts which naturally possess a superior climate and other beneficial influences this invaluable vegetable can be produced in a state of great excellence without the uncertainty as to actual results that must inevitably exist at other less favoured localities where, as a natural consequence, its cultivation will always be attended with some degree of doubt and difficulty. In point of fact we have only to take the present season—which has been extremely fatal to these plants—as an instance to verify this statement. However, we are still encouraged in this pursuit by the fact that even under the pressure of such exceptional circumstances we now possess in a satisfactory state about a third part of the original planting of the following kinds:—Leamington, Dalmeny Park, and Williams' Alexandra. Of other sorts which we have grown this year, such as Frogmore Protecting, Penzance, and Haywood's White Queen,

the loss has been much greater in proportion. In my opinion, if in the process of cultivation, in private establishments more particularly, the requirements of this subject had more consideration, such severe losses among the plants as are to be met with even in ordinary seasons would be materially reduced, and a corresponding degree of success would thereby be attained.

In the case of that section of the plants which is required to produce heads during the autumn months the soil can scarcely be over rich or moist for the purpose, and the plants, if raised in a natural way, can scarcely be got ready for planting out too soon, and the kitchen garden proper will be a suitable place for them; but to put plants which are intended for a spring crop in soil so fertile and full of manure, and in places so sheltered, I consider to be a mistake altogether, because the conditions are such as simply tend to produce in the plants a succulent growth, which by the force of local surroundings becomes attenuated and tender, and is thereby prepared to suffer material damage from the first severe frost that comes, while subsequent ones as a rule finish them off entirely. To pass this order, plants, particularly Broccoli plants—which are somewhat tender, intended to give the spring crop of heads, and to withstand the effects of our winter seasons—such plants should be formed as sturdily as possible, and this unquestionably can best be effected by planting them in open and exposed places, slightly elevated, where the soil is tenacious in character, of fair average depth, and moderately enriched with manure or other fertilising agents.

Sow the seed early in March, and when the plants have become fit for transplanting permanently take advantage of showery weather for the purpose, so that they may get established by the time very dry weather sets in. Enough space should be allowed between the plants for them to make a proper development. As a rule, for this end 2 feet apart every way will be sufficient. The after-treatment that is necessary is simply to keep the surface-soil free from weeds and stirred occasionally to encourage growth, and when autumn arrives to remove all useless and decayed leaves from the stems in order to admit a free circulation of air amongst them. Local circumstances sometimes create difficulties in the way of success in cultivating some subjects, and recurrent and vexatious disappointment with it often leads to increased efforts to overcome them. Such, at least, has been our experience here with regard to the Broccoli plant for spring purposes, and until we ceased to grow them in this damp and fertile valley, our endeavours invariably ended in disappointment if not actual defeat.

A considerable quantity of rain has fallen lately and so saturated the soil as to necessitate the postponement of sowing the general crop of Onions, Carrots, and Parsnips. Light friable soil, such as is commonly to be found in established gardens, will need to be made somewhat firm before the seed is put into the ground; let, therefore, the places intended for these crops be trodden down and roughly raked over before the drills are drawn. These should run from 12 to 18 inches apart, according to the fertility of the soil. After the seed is raked in, another light treading over will be beneficial. On the other hand, where the soil is strong and adhesive no treading will be requisite, and as such land is cold and late compared with that before described, wait until it is in a proper state; a delay in this way is oftentimes more than compensated for in general results.

About the first week in March make the general sowing of seeds of the Brassica tribe on an open space, and take precaution to protect the seeds from the attacks of birds. At about the same time make a small sowing of Turnip seed, and supplement it by another sowing in about a fortnight's time. Many of the plants from these sowings will, doubtless, shoot into seed; this will in some degree be avoided by sowing in open places. We like the American White Strapleaf kind for this purpose. See likewise to the sowing of Radishes and Lettuce at intervals to maintain a regular supply.

Autumn plantings of Lettuce and Cabbage plants will after the operation of frost demand attention, and so also will the Spanish section of Onions which were sown at the same time; if any of these plants be loosened, press them in firmly again if not yet done. Any ground which is wanted for Cauliflower plants that is not prepared for them should be seen to, as the time will soon arrive for the general crop of these plants to be put out. Plants which are already out in hand-glasses should be well ventilated by day, and those in frames should be fully and constantly exposed unless very severe weather prevails. *G. T. Miles, Wycombe Abbey.*

### FRUIT HOUSES.

**PEACHES AND NECTARINES.**—The principal work in the early house during the next fortnight will be the final disbudding and tying-in at the base of the shoots intended to form the fruiting wood for next season. As growth proceeds it is more than probable

that many of the young shoots that have been pinched to form spurs will have to be entirely removed, to make room for the full development of the foliage; but in many parts of the trees their retention will result in clusters of flower-buds, which invariably ripen well, and at the same time produce an even spread of foliage, where its shade will protect the old branches from the influence of the sun's rays. Trees which have set abundantly may now be divested of the least promising fruit, particularly where triple flowers were not thinned before they opened. It will as a matter of course be necessary to leave a much greater number of Peaches than is likely to be required by the most covetous cropper; but in every instance where triples are swelling the two outside ones should be removed for the benefit of the finest, which is always found in the centre. These do not, however, as a rule give the finest fruit, neither do they go through the stoning process so well as fruit from fine single blooms placed on the upper sides of firm, short-jointed wood. Although the month now passing away has been moderately mild, the absence of sun has obliged us to keep the fires going, and under this influence it is not unlikely that red-spider will be found in proximity to the pipes. Should this be the case the syringe must be vigorously applied until the enemy is brought into subjection. At the same time internal borders must be examined, well mulched with short horse-dung, and copiously watered if it is found that they are at all dry or approaching that state. The most fertile cause of spider is poverty and aridity, the best antidote is moisture, ammonia, and generous food. As the fruit increases in size great care must be observed in the choice of water for syringing purposes. Rain-water is the most suitable, but if this cannot be procured, that which contains the smallest quantity of lime will be the best substitute. Ventilate early and by degrees as the temperature increases, and reduce in the same way. Close up entirely, and run up the temperature after the afternoon syringing, and give a little night air on all favourable occasions. Succession-houses now in flower will require a free circulation of air with sufficient fire-heat to keep it buoyant, and to prevent sudden changes of temperature. Pass the brush over the flowers on fine days. Keep the paths and borders moist when the weather is fine, and allow them to become dry when external conditions are unfavourable. Trees having their roots in the external borders of late houses are still backward, but this condition must not cause alarm, as time can be redeemed, even in unheated houses, if such still exist, after the fruit has passed the early stages. Let the doors and ventilators remain wide open at all times when the house stands above the freezing-point, and keep the borders cool by means of light, but not over-rich mulching. In the selection of Peaches and Nectarines for cold houses, preference should be given to late-blooming kinds which have small flowers. *W. Coleman, Eastnor.*

#### ORCHARD-HOUSE.

If the trees in the forcing-house are in flower, it will be necessary to exercise due caution to prevent any injury to the blossoms. A stagnant moist atmosphere is exceedingly injurious, and should by all means be avoided. The hot-water pipes should be kept warm by day as well as at night; air must be admitted freely by day, and the ventilators should also be left open a little at night, unless a frosty wind should be blowing. When the fruit is set the trees should be thoroughly syringed in the morning with tepid water, and this operation should be daily repeated; the temperature at night may be 55°, but in the case of Peach and Nectarine trees injury may accrue from too much artificial heat. If there are Strawberry plants on the shelves these must be well syringed underneath the leaves at the same time as the Peaches: the object in each case is to deter red-spider from attacking the leaves. The syringing of course causes a moderately moist genial atmosphere, which suits the trees very well after the fruit is set and is swelling freely. It is a sign of a healthy state of matters when the leaves are edged in the morning with a row of dewdrops. In the later house the buds are now swelling rapidly, and there are plenty of blossom-buds, but little need be added to previous cultural remarks. The trees merely require attention as regards watering at the roots; if any one of them should become over dry at this time the result would be to lose the crop of fruit for this season. Previous remarks have had special reference to Peach and Nectarine trees, but the Apricot may be grown in pots under glass, and the fruit obtained is of exceedingly good quality. The trees come into blossom the earliest of all, and for this reason alone it is desirable that they should be under a glass shelter; the trees ought not to be syringed at all, as not only do they prefer a drier atmosphere than the Peach, but the leaves are not attacked by red-spider. The Plum and Pear require very similar treatment. I have found the blossoms fail to set in bad seasons, when the blossoms on the Peach trees have set fairly well; some varieties are worse than others in this

respect. When I first began the culture of orchard-house trees, the Peach and Nectarine had the part of the house most freely exposed to the sun, but years of experience has proved to me that the Pear, Plum, and Apricot should have the best position when the trees are in flower; it is easy enough to remove them to another place when the fruit is fairly set. Usually there is only one compartment for all kinds of fruit, but it is better if one compartment can be reserved for Peaches and Nectarines, and another for Pears, Plums, and Apricots. *J. Douglas, Lovford.*

#### ORANGE-HOUSE.

If any of the trees require repotting it may yet be done. I have sometimes repotted them after the fruit has been set, but in that case the roots must not be injured. I have seen the following compost for Orange trees recommended on good authority, viz., one part rotten manure, one part leaf-mould, and two parts turfy loam: this I consider far too rich. Four parts of turfy loam to one of rotten manure, with a small portion of half-inch bones, answers better; bone manure is very suitable for Orange culture. Do not over-pot, shift from an 11-inch pot to a 13-inch, or from a 13-inch to a 15-inch, and the trees may remain in that size for at least three years; continue to apply surface-dressings as the trees require it. Manure-water is also beneficial when the fruit is swelling. When the trees have been potted root-action will be much promoted if the trees can be placed over a hot-bed with a gentle heat; the pots should not be plunged into, but simply stood on the bed. *J. Douglas, Lovford.*

#### PLANT HOUSES.

ORCHIDS.—Many of those deciduous or semi-deciduous plants which take a decided rest during the winter months will now commence to grow, and must therefore be kept no longer under the resting treatment. Such plants as *Anguloa Clowesii*, *A. Ruckerii*, *A. uniflora*, *Chysis bracteosa*, *C. Limminghii*, *C. aurea*, *C. Levis*, and *C. Chelsoni*, throw their flower-buds up along with the young breaks, and should, therefore, not be disturbed at the roots by potting or basketing till after the flowers have faded. Keep the *Anguloas* still in the intermediate-house, but the *Chysis* should be suspended in the Dendrobium-house so as to get abundance of light, heat, and air. Water often enough to keep the roots of all the plants mentioned moist. All members of the *Mormodes*, *Catasetum*, and *Cynoches* family should now be shaken out of their old compost and be repotted into equal parts of peat and sphagnum. The pots ought to be half-full of crocks, and all long heavy bulbs will require a stake and tie to hold them firm. *Mormodes luxatum* and *M. Greenii* do best in the *Cattleya*-house; all the other kinds delight in a strong heat and a clear light while growing. For the next few weeks water sparingly; then, if the new roots have run through the compost, give abundance. *Thunia Bensoniae*, *T. Marshallii*, *T. alba*, *T. nivalis*, and *T. (Phaius) Dodgsonii* must now be shaken out from their old compost and be repotted. Three-parts fill the pots with drainage, over which place a layer of fibry loam with peat and sphagnum above. The roots will find out the loam, to the benefit of the plants, about the time the flower-buds show. Place these *Thunias* so that the tips of the old bulbs nearly touch the roof-glass in the *Dendrobium*-house. Where such bulbs are over long arch them over at top and tie them down, so that the young breaks at their base may be got nearer the glass, for unless these get a maximum of light flowering is out of the question. As with the *Mormodes*, &c., so with these as regards watering. *Calanthe Veitchii* and the varieties of *C. vestita* should now be potted up in a mixture of two-thirds loam, one-third peat, and the addition of a little drift-sand. Give good drainage, and place the plants in a light position in the *East Indian*-house. *Limatodes rosea* should be treated the same. This plant has been, and is, rather snuffed out by the more robust *C. Veitchii*, but it possesses a delicate pink colour of its own, a very compact inflorescence, and is altogether a charming Orchid. Where *Peristeria elata* and *P. cerina* have been wintered in the intermediate-house they should now be placed in a few degrees more heat, and receive a growing treatment. So soon as *Ipsa speciosa* and *Spathoglottis Lobbii* have passed out of flower let them be repotted or repanned, using a mixture of peat, chopped sphagnum and sand, with plenty of drainage. Both plants require abundance of heat and water. The singular and handsome *Vanda Cathartii* now flowering is one of those Orchids that is rather particular as to position and treatment. It will grow luxuriantly if trained up the outside of a teak-rod cylinder and placed in a hot moist corner of the *East Indian*-house. This plant will take as much heat and moisture as a *Nepenthes*. The same may be said of the beautiful *Dendrobium M'Cartbii*, which, in fact, speedily dwindles away under any other treatment. No time must be lost in top-dressing with fresh sphagnum such plants as *Saccolabium*, *Phalænopsis*, *Aerides*, *Angraecums*, &c., for with an increase of daylight and

sunshine their roots will soon send forth those young tender growing points which a slight touch will either injure or break. The present is an excellent time to give more root-room to any of the cool Orchids requiring such, and which are not flowering. The young stock of *Odontoglossums*, *Masdevallias*, and *Oncidiums* should be first seen to, as many of the older established plants will be passing through their flowering season, during which it is unwise to disturb their roots. Such plants are best potted about a week after they have done flowering. All plants that have root-room enough to carry them till next September will now only need top-dressing. The potting of cool Orchids should be so regulated that few or no plants have to be shifted during the heat of summer, as that is to them a very trying season, through which many of them are far more inclined to rest than to grow. That curious flowering plant, *Nanodes Meduse*, must now receive liberal and frequent waterings. It is a very difficult thing to import and establish, but when once rooted in well drained peat and sphagnum, and kept constantly cool and moist, it will grow and flower freely. The flowers, which are large, and which last longer in perfection than any other Orchid I am aware of, are produced on the ends of the leafy growths; the full beauty of such can only be seen by looking through them towards a good light; for this reason the plants should be suspended in pans or baskets. Immediately *Pleione humilis* and *Hookeri* pass out of flower let them be done up in shallow pans of peat and sphagnum, and suspended near to a roof-ventilator of the cool-house. Any plants of *Cymbidium Mastersii* or *C. affine* that require potting must at once be seen to. Pot them in the mixture recommended for *Calanthes*, using rather large pots, and they will make clean strong growths and splendid spikes. The white variety of the former, lately named *alba*, is without doubt a superb old Orchid. *J. C. Spyers, Burford Lodge, Dorking.*

#### TOWN GARDENING.

The present is the best time to turf bare spaces under trees in towns. If it is done in the autumn the soot and filth that fall off the trees during the winter kill the grass, and it has to be done over again. Sow a little grass seed on lawns where the grass has become thin, and also a little Dutch Clover, but make the sowings separately, as if done together the Clover seed, being the heaviest, will all settle in one place. Where lawns have been top-dressed it is necessary that they should be bush-harrowed, or raked over with a short-toothed rake, before they are rolled, to work the top-dressing well into the roots of the grass and also to let the young blades of grass through where the top-dressing is caked. Beds that are intended for sub-tropical plants should have special attention now. If they are not drained they should be. *Musa* and *Canna*, although great lovers of water, should nevertheless have good drainage, so that the water may freely percolate through the soil to keep it sweet. Bedding *Petargoniums* should now be potted off into large 60-sized pots. Commence with the variegated section first, these being the tenderest, next the pink section; and thirdly, the scarlets. Propagate *Colens*, *Iresine*, *Mesembryanthemums*, and all other tender bedding plants, without delay, with the exception of *Alternantheras*, and they should not be put in until the end of March or the beginning of April. The cuttings of *Alternantheras* are taken off for winter stock in August, struck in shallow pans plunged in a dung-bed. When they are struck, which will be in the course of a fortnight or three weeks, each cutting is pinched back to two joints; then in the course of another fortnight, having made two fresh shoots, they are potted off, five in a 48-sized pot, in a compost of yellow loam, leaf-mould, and a little silver-sand, placing them again on the manure, when in the course of a short time they are well established, and prepared to stand the winter. In the beginning of October they are placed on a shelf near the glass in a warm greenhouse, and there they remain till the beginning of February, when they are placed in a heat of 60° or 70° as the season advances. By the last week in March or the first week in April they will have made good growth, so that strong cuttings may be taken off, for small miffy cuttings are worse than useless. The cuttings are then taken off and inserted in a compost of loam and leaf-mould, adding a little silver-sand, in shallow pans, and plunged in a dung-bed. After the first batch of cuttings are struck the old plants are thrown away, for better cuttings are obtained from the young plants, which are then potted off in small 60-pots in a compost of leaf-mould and yellow loam, and plunged in a bed of new Hops, already prepared, there to remain until they are required for bedding out, but in the meantime they are given plenty of water and exposed to the full sun and air when favourable. By this mode I have grown *A. amoena* 6 to 8 inches in diameter, and well coloured; and *magnifica*, *amabilis latifolia*, *paronychioides*, and *paronychioides major* much larger. Any one who has not tried Hops, I would advise to do so. *W. Gibson, Royal Hospital, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY,	Mar. 1	Sale of Lilium auratum, Krameria, and Mediolobes and other Japanese Bulbs, at Stevens' Rooms.
		Sale of Japanese and English-grown Lilies, Orchids, &c., at the Mart, by Frotheroe & Morris.
TUESDAY,	Mar. 2	Clearance Sale of Nursery Stock, at Lang's Nursery, Teddington, by Frotheroe & Morris.
		Clearance Sale of Nursery Stock, at Collett's Nursery, Horsell, Woking, by Frotheroe & Morris.
WEDNESDAY,	Mar. 3	Sale of Standard and Dwarf Roses, Fruit Trees, Shrubs, Gleditsia, &c., at Stevens' Rooms.
THURSDAY,	Mar. 4	Meeting of the Linnean Society, at 8 P.M.
		Sale of Established Orchids, Camellias, &c., at Stevens' Rooms.
FRIDAY,	Mar. 5	Clearance Sale of Nursery Stock, at Mann's Nursery, Brentwood, by Frotheroe & Morris.
SATURDAY,	Mar. 6	Sale of Hardy Plants and Bulbs, &c., at Stevens' Rooms.

THE effects of UNINTERRUPTED SUNLIGHT on PLANTS! Such is the title of an article in a recent number of *Nature*, which must prove rather exasperating to gardeners, who to their loss know more of the effects of uninterrupted sunlessness than of the opposite condition. Nevertheless the article in question, which is based on the observations of Dr. SCHUBELER, of Christiania, is one well worth attention. Dr. SCHUBELER, whose name and works are well known to physiologists and plant lovers in this country, undertook some experiments with the special view of noting what effect the almost unbroken sunlight of the short Scandinavian summers had on plants raised from foreign seed. The experiments were made with samples of Wheat obtained from Bessarabia and from Ohio, and in both cases we are told it was found that the colour of the grain gradually acquired each year a richer and darker hue, until it finally assumed the yellow-brown tint of other home-grown Norwegian winter Wheat. Similar results were obtained with Maize, different kinds of garden and field Peas and Beans, Celery, Parsley, &c. In almost all cases the common garden flowers of Central Europe gain in size and intensity of colour when transferred to Norway. These differences become more marked the further north we go, exactly as happens in the case of plants growing on the lower and upper parts of a mountain respectively.

Not only is the colour intensified, but the aroma of all wild and cultivated fruits capable of cultivation is much greater than that of the same fruits when grown in more southern countries. The Norwegian Juniper, for instance, yields a much larger amount of essential oil than can be obtained from the shrub when grown in Central Europe. The excess of aroma, however, is, it seems, accompanied by a deficiency in sweetness; thus the Golden Drop and Green Gage Plums grown in Norway, though large, well-coloured, and rich in aroma, are so deficient in sweetness as to appear unripe to those who have eaten these fruits in France or Germany. Dr. SCHUBELER quotes Dr. GOEZE, who resided at Coimbra for some years as Curator of the Botanic Garden, to the effect that the Portuguese Strawberries are large, extremely sweet, but almost wholly deficient in aroma and flavour. A similar remark is applicable to the Portuguese wines when compared with the highly flavoured yields of the Rhenish and other northern vineyards, whence the conclusion that light bears the same relation to aroma that heat does to sweetness. When, as happened last year, we had little heat and less light, it is no wonder that our fruits were defective alike in flavour and sweetness. Some of our most

savory herbs and plants become uneatable in Norway from the increased development of the flavouring principle. Celery grown in Norway in the same manner as in England, and presenting no difference in outward appearance from samples sent direct from Covent Garden, was nevertheless so sharp and unpleasant to the taste as not to be relished, and the same remarks apply to Garlic, Onions, &c. This may perhaps in part be accounted for by different conditions of soil or manuring.

These facts, be their interpretation what it may, have been observed by Dr. SCHUBELER and his associates for the last thirty years, and they warrant him in recommending the culture of certain plants, as Linseed, Lavender, &c., in various parts of Norway. Among other curious observations recorded by Dr. SCHUBELER may be mentioned the fact that leaves of *Acacia lophantha* grown in the polar regions never contracted their leaves during the two months or longer that the sun remained above the horizon. One half of an *Acacia* was shaded during the night, with the result that the shaded leaves began shortly to contract and remained closed till the plant was again wholly exposed to the midnight sun, when after a time the leaves began slowly to unfold.

Dr. SCHUBELER's general conclusions are thus given:—

"1. The grain of Wheat that has been grown in low-lying lands may be propagated with success on the high fields, and will reach maturity earlier at such elevations, even although at a lower mean temperature. Such grain, after having been raised for several years at the highest elevation which admits of its cultivation, is found when transferred to its original locality to ripen earlier than the other crops which had not been moved. The same result is noticeable in grain that has been transported from a southern to a more northern locality, and *vice versa*.

"2. Seeds imported from a southern locality, when sown within the limits compatible with their cultivation, increase in size and weight, and these same seeds, when removed from a more northern locality to their original southern home, gradually diminish to their former dimensions. A similar change is observable in the leaves and blossoms of various kinds of trees and other plants. Further, it is found that plants raised from seed ripened in a northern locality are hardier, as well as larger, than those grown in the south, and are better able to resist excessive cold.

"The further north we go—within certain fixed limits—the more energetic is the development of the pigment in flowers, leaves, and seeds. Similarly the aroma, or flavour of various plants or fruits, is augmented in intensity the further north they are carried within the limits of their capacity for cultivation; conversely, the quantity of saccharine matter diminishes in proportion as the plant is carried further northward."

The practical conclusions to be drawn from these experiments are numerous and too obvious to need special reference; but in view of the proved fact that, by the use of the electric light, the same changes in the physiological action of the leaves are produced as by the sun's agency, we again call attention to the desirability of fully testing the application of this source of light for purposes of forcing. Heat and moisture are at command; light has hitherto been much less so. Will not some electrician, with a taste for horticulture, endeavour to intensify the colour of forced flowers and to heighten the flavour of forced fruit? The means of carrying out such experiments as would be needed are not within the reach of many, but our horticultural societies and physiological laboratories might surely find interesting and profitable results in their prosecution.

— BOTANICAL AND HORTICULTURAL CONGRESS AT BRUSSELS.—In connection with the Horticultural Exhibition which is to take place in Brussels from July 23—26 next, during the *Fêtes* commemorative of the fiftieth anniversary of Belgian independence, it has been decided to organise a Congress. The Congress will be held in the Botanic Garden, and the subjects for discussion will be of a practical nature relating to botany and horticulture. The Congress is promoted by the Royal Botanical

Society of Belgium and the Royal Linnean Society of Brussels, the secretaries being M. BERNARD and M. F. CREPIN, to either of whom communications should be addressed at the Botanic Garden, Brussels. The subjects proposed to be treated of are the following:—

The best method of drawing up monographs of large genera.

The best method of reproducing the imprints of fossil plants.

Organisation of a botanical school for teachers.

Arrangement of collections of vegetable products in botanic gardens.

Arrangement and preservation of herbaria.

The best system of labelling for botanic gardens, parks, nursery gardens, and pleasure gardens.

The best method of growing bulbous plants.

The foundation and maintenance of lawns.

The culture of alpine plants.

The effects of the winter of 1879-80, and the precautions necessary to protect plants against severe frosts.

Shading of plant-houses.

Instruction in botany in primary and middle schools.

Botanical museums for schools.

Modifications in the nature of the awards made at horticultural exhibitions.

— MARKET GARDEN SUPPLIES.—If a stranger to the everyday life of our metropolis were to take his stand in the chief western thoroughfare leading to the market garden districts, say in the town of Brentford, for instance, he would not fail to remark, upon any Saturday, commencing about mid-day, and continuing almost without intermission till night, the remarkable stream of market waggons and carts, all heavily laden with manure and empty baskets, returning from London to their suburban homes. The to him unwonted spectacle would not improbably lead to the paraphrasing of MACAULAY's lines thus:—

"The long stream of market wains  
Roll down the western street."

The big horses lumber along, tired and dirty; the drivers are weary and sleepy, for none of them have seen bed for perhaps thirty-six hours, and will be only too pleased when they reach home, and can find the slumber and repose Nature so much needs. These hundreds of vans have brought in from the numerous localities of Isleworth, Hounslow, Twickenham, Hanworth, Feltham, Cranford, Harlington, Stanwell, Sunbury, and several other Middlesex parishes, the part produce of thousands of acres of fertile soil devoted to the production of vegetables and fruit for the sustenance and well-being of the teeming millions of the metropolis. With a population increasing at a marvellous rate, with new streets, squares, and habitations fast covering the areas once devoted to the culture of garden products for past generations, forcing the growers farther and farther into the country, comes a necessary increase in this remarkable traffic, for both quantity and mileage must grow with the necessities of the case. Even whilst our market growers are sending into London in their waggons their thousands of tons of good wholesome, healthy food, so also do they in a large way act as sanitary scavengers, carting out (unfortunately, in the very same waggons) from the midst of the dense population thousands of tons of manure that otherwise would but become a nuisance and a curse, but which, carted into its proper place—on to the fruitful land—in the course of Nature evolves life-giving food and blessings for our vast town people.

— THE KINGDOM OF MEDINA.—Official advices have been received at the Liberian Consulate-General of the annexation by the Republic, on mutual and peaceful terms, of that vast and important country adjoining the interior frontier of the Republic, known as the kingdom of Medina. Medina abounds in the richest of African productions; there are thousands upon thousands of acres of gold and iron fields; its forests are teeming with Ebony, Palm, gum, and rubber trees, while the now well-known Liberian Coffee tree is found growing spontaneously to the height of 30 and 40 feet. In this new acquisition Liberia has opened still wider the door into the interior of Central Africa. The Medina Bopora country, with its 700,000 souls, will, with the exception of the Coffee plantations on the St. Paul's River, form the richest and most populous portion of the Republic. Extraordinary impetus has lately been given to agricultural pursuits in Liberia, owing to the great demand for Liberian Coffee seeds and plants in almost every Coffee-growing country.

— HORTICULTURE AT SINGAPORE.—We learn from the *Straits Times* of January 10, that the first annual exhibition of the Singapore Horticultural Society, held on December 30 and 31 last (about which we gave some particulars at p. 659 of our last volume), was a complete success in all but the attendance of visitors, which, owing to unpropitious weather, was somewhat limited. It appears that "the great feature of the show in the competitive classes was undoubtedly the fine-leafed Begonias. The plants were magnificent, and no one unacquainted with the luxuriance of tropical vegetation could possibly form any idea of their gigantic proportions." There seems also to have been an excellent competition in the classes for three

of European vegetables. However, "in the next class, which was for native vegetables, TAN KOH, gardener to E. KOEK, Esq., exhibited a nice collection, comprising most of the kinds grown by the natives here, and which deservedly secured the 1st prize. TAN KOH also secured the 1st prize for both white and red Sweet Potatoes with very large tubers. An honourable mention was awarded to the Venerable Archdeacon HOSE for a basket of Jerusalem Artichokes, very creditably grown for this climate. In the class for a good deal of competition was shown, Captain ROSS securing 1st prize for Pumpelows: they were two beautiful, thin-skinned, well-flavoured fruits. E. KOEK, Esq., was awarded the 1st prize for Plantains, for a fine sample of the var.

Coleus, Begonias, &c., of enormous dimensions and well coloured. The Ferns were beyond description, consisting of masses of Adiantum, notably *A. anabile*, 7 feet through; also a crested variety of *Nephrolepis davallioides*, of which there were three plants still larger, and enormous Tree Ferns. Rare Caladiums and fine-flowered Roses, with others too numerous to mention, made up a lot of plants, forcibly reminding one of the specimens that used to be exhibited in London and the provinces by BAINES, COLE, and others; and too much praise cannot be given to Mr. HURTON, head gardener to H. H., for the very effective way in which he arranged the collection, under the personal direction of H. H. himself. The Honourable

FIG. 50.—*ABIES VEITCHII*: BRANCH WITH CONES, NAT. SIZE; BRACTS, SCALES, AND SEEDS, MAGN. TWICE; TRANSVERSE SECTION OF LEAF, MAGN. TEN TIMES. (SEE P. 275.)

and six Ferns; and the writer of the *Straits Times* report remarks with reference to them:—"Perhaps in no place in the East is so much attention paid to the cultivation of Ferns as in Singapore, and it is a gratifying fact that a very great desire is springing up amongst the residents here to learn the names and all particulars regarding this beautiful class of plants. The display on this occasion could not have been surpassed in any metropolitan show, and after three years' experience of exhibitions at Regent's Park, the Crystal Palace, and other places in London, the writer is bound to confess that nothing he has ever seen there could surpass the grand collection displayed here." It is interesting to read further on that there is a Mr. MILES at Singapore, as in Buckinghamshire, who can grow Cabbages sufficiently well to obtain the 1st prize, but not so cheering to learn that no prizes were awarded in the class for a collection

Rajah; M. RIBEIRO, Esq., following, with a larger but insipid sample of the var. Tandok. The Hon. H. A. K. WHAMPOA, C.M.G., gained the 1st prize for twelve Oranges, and J. F. NICHOLSON, Esq., was awarded the 1st for Mangosteens. The Rambutans were under the average. Two lots of Durians were contributed, the 1st prize falling to A. C. MOSES, Esq., for two highly smelling specimens. Three collections of fruit were exhibited and were very interesting, consisting of Rambutans, Polesans, Sentoels, Rokums, &c. The show was greatly enhanced by a collection of 150 specimen plants sent by H. H. the Maharajah of Johore, K.C.S.I., who has taken a warm interest in the Horticultural Exhibition. The collection occupied a considerable portion of the centre stage, and was remarkably well grouped. Few places in England could have brought together such a grand display—magnificent Crotons,

H. A. K. WHAMPOA, C.M.G., one of the members of the committee, also sent some examples of Chinese modes of training plants, which were much appreciated."

— APPLES FOR CULTIVATION FOR MARKET.—There are three varieties in particular that are strongly recommended for this purpose by such a renowned fruit cultivator as Mr. FRANCIS N. DANCER, Little Sutton, Turnham Green—viz., Ecklinville Seedling, an Irish Apple, raised more than half a century ago near to Belfast, bearing large and handsome fruit—an excellent culinary Apple, and a free and reliable bearer, in use during the last three months of the year; Stirling Castle, a valuable early variety for culinary purposes, coming into use early in August, and bearing immense crops of fruit; and Warner's King, a very favourite culinary Apple of the

finest quality, bearing large and weighty fruit, in use from November till March. Stirling Castle is an Apple that is well adapted for culture in the bush form, and is therefore suited for small gardens. In a villa garden, where there is but limited space, and a good and useful selection is necessary, the three foregoing varieties would suffice to keep up a supply, beginning with Stirling Castle, following with Ecklinville Seedling, and finishing up with Warner's King. The value of these three varieties for market purposes lies in the fact that the trees bear in a young state, they crop heavily and pretty constantly, while the fruit is in each case of taking appearance and fine quality. In such a case as this, the lead of an authority and enterprising pomologist as Mr. DANCER is well worth following.

SEA SAND FOR CUTTINGS.—Mr. CANNELL calls our attention to the value of this material for striking cuttings, and certainly the sample of Coleus he sends struck some in sea sand some in ordinary pit sand show that the superiority is with the sea sand. We are assured that the sand has been in no way prepared prior to using, so that the notable quantity of salt it must contain cannot have injured the plant, nay in some cases it may have a distinct manurial value, while in other cases it may prove injurious.

ORCHIDS IN FLOWER AT BEARDWOOD.—The following Orchids are now in flower in the fine collection at Beardwood, Blackburn, the property of R. DODGSON, Esq. Cattleya Trianae is well represented, and especially the variety named after the owner, which is remarkably fine. It has in all seven flowers, with the sepals and petals white, the lip a beautiful deep crimson, and the throat orange-yellow. Some of the flowers have measured over 8 inches in diameter. This is undoubtedly one of the finest of the Trianae section:—

Table listing orchid species and their characteristics, including Cattleya quadricolor, amethystoglossa, and others.

HELLIWELL'S SYSTEM OF GLAZING has, according to a Jersey paper, been adjudged the 1st prize in the competition for plans for the construction of the new market at St. Heliers. The 2d prize went to Messrs. BROMLAW & CHEERS.

ORCHIDS IN FLOWER AT MR. BULL'S.—The following Orchids are now in flower at Mr. WILLIAM BULL'S Establishment for New and Rare Plants, King's Road, Chelsea. The Cattleyas, Odontoglossum odoratum, and the rare Odontoglossum Ruckerianum, are very fine:—

Table listing orchid species and their characteristics, including Ada aurantiaca, Cattleya Trianae, and others.

"NEW COMMERCIAL PLANTS."—Mr. CHRISTY has issued a third part of this publication. It will be seen that some of the plants mentioned can scarcely claim to be called new. They are—

Teosinte, or Euphonia luxurians; Tagasaste, or Cytisus proliferus; Symphytum asperrimum, Lalle-mantia iberica, a new oil plant, from the Levant; Maté, or Paraguay Tea; the Kola-nut tree, Cola acuminata; Coca, or Erythroxylon Coca; Pituri, or Duboisia Hopwoodi, a stimulant narcotic, from Queensland, the active principle of which is said to be identical with nicotine; the Papaw-tree, Carica Papaya; Japanese Peppermint, Mentha sp.; the Cow-tree, Galactodendron utile; Mahwah, the flowers of Bassia latifolia; Chaulmagra oil, Gynocardia odorata, &c.

BARGAINS.—Those who are fond of bargains, wish to be well served, and to obtain novelties not known to the trade, will do well to consult the Bazaar. From the issue of that journal for January 21, 1880, we call the following advertisements of garden produce—paid for, we presume, at the usual rate of 4d. for twelve words:—"Nice bulbs of the Indian Shot-plant, very ornamental, and produces masses of white flowers bearing shot-like seed resembling bullets—a great novelty." We should think so. Here is another:—"Novelty in Roses.—Empress of India: blossoms 24 inches in circumference, colour rich velvet-crimson. Strong plants, price 2s. each, free." Another advertiser "can still spare some well rooted plants of the Empress of India, which grows 2 feet in circumference; also the new black Rose, both great novelties; 2s. 6d. each, free, or the two together for 4s." The black Rose seems to be plentiful; here is another offer:—

"The wonderful black Rose, each petal positively rich black: strong plants, 2s. 6d. each. Also the largest Rose in the world, produces flowers 24 inches in circumference, and very double. Plants 2s. 6d. each. One good plant of each of the above free for 4s."

A "new and beautiful scarlet Passion-flower for window or greenhouse, almost hardy, and large double flowers, nice little plants," is offered by the same lady who deals in white-flowered Indian shot-plants with shot-like seed resembling bullets.

Novelties.—The wonderful new Bean, Bolster-case: produces pods from 9 inches to 12 inches in length, look like long Cucumbers hanging from the stalk: delicious vegetable. Twelve Beans free for 1s. 6d. Also the new Pea, Cleopatra's Needle: grows pods 6 inches or 7 inches in length, and an enormous size. Thirty-six Peas free for 1s. 2d."

"Scarlet Musk: one, 1s.; two, 1s. 10d.; three, 2s. 6d., hardy strong roots, free."

"American Healing: cures all bruises, swellings, burns, &c.; evergreen, hardy. One root, 1s.; or three, 2s., free."

We are far from asserting that all the advertisements are of the same character. We have simply picked out a few curiosities, inserted, no doubt, in good faith, but, for all that, rather calculated to mislead.

ORCHIDS IN BLOOM.—The following Orchids are now in flower at Messrs. JAMES VEITCH & SONS' Royal Exotic Nursery, Chelsea:—

Table listing orchid species and their characteristics, including Ada aurantiaca, Angraecum citratum, and others.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—The dates selected for holding the spring, summer, and autumn exhibitions of this Society, in the Waverley Market, Edinburgh, are April 7 and 8; July 7; and September 8 and 9.

LIBERIAN COFFEE.—In an official report on a survey of the west and interior of Liberia, made by order of the United States Government, Captain VREELAW, of the United States Navy, in speaking of the Liberian Coffee, says:—"Some plantations have as many as 200,000 trees, producing from one to four and sometimes 12 lb. per tree, worth at Monrovia eighteen cents per pound. The tree produces in its third year, and thence on to thirty years. Estimating 450 trees to the acre, and a yield of 4 lb. per tree, we have at the end of the seventh year 324 dols. per acre annually. The labour for this production is small, the rains are abundant, and with simple machinery, invented and made in America, the berry is extracted from the hull. Colonies and India.

CANTERBURY AND EAST KENT ROSE SOCIETY.—The second exhibition of this Society will be held in the Corn Exchange, Canterbury, on July 1.

OXFORD ROSE SOCIETY.—The twenty-ninth annual exhibition of this Society will be held on July 6, and, by permission of GEORGE HERBERT MORRELL, Esq., in the beautiful grounds of Headington Hill Hall.

WEST KENT HORTICULTURAL SOCIETY.—On Saturday, July 10, the annual exhibition of this popular Society will be held in Camden Park, Chislehurst.

SOUTHAMPTON HORTICULTURAL SOCIETY.—The summer show of this Society will be held on July 31 and August 2; and the autumn display on November 16 and 17.

FAREHAM AND SOUTH HANTS HORTICULTURAL SOCIETY.—The date fixed for holding this Society's annual exhibition is Wednesday, July 7.

PUBLICATIONS RECEIVED.—Handbuch der Botanik. Von Dr. N. J. C. MÜLLER, Erster Band (WILLIAMS & NORGATE).—Illustrirtes Garten Lexicon. By TH. RÜMPLER (WILLIAMS & NORGATE). For those who read German this promises to be a valuable garden dictionary, including articles on garden plants, garden constructions, and on the sciences pertaining to gardening. It is well illustrated with numerous cuts.—Les Orchidées, &c. Par E. DE PUYDT (ROTHSCHILD, Paris; DULAU & Co., London). A companion volume to the Palms of M. DE KERCHOVE. We shall have further occasion to speak of this fine volume.—La Culture Maraichère. Par A. DUMAS (Paris, ROTHSCHILD; London, DULAU & Co.).—La Pisciculture, par JULES PIZZETTA; et L'Ostréiculture, par M. DE BON (Paris, ROTHSCHILD; London, DULAU & Co.).—Pathologie des Poissons. Par MICHEL GIRDWOYN (Paris, ROTHSCHILD; London, DULAU & Co.).—A Year's Work in Garden and Greenhouse. By G. GLENNY (CHATTO & WINDUS).—The Cotton Worm. By Professor C. V. RILEY (Department of the Interior, Washington, U.S.A.).—The Sugar Beet. By L. S. WARE (Low & Co.).

THE WEATHER.—General remarks on the weather during the week ending February 23, issued by the Meteorological Office, London:—"The weather during this period has been showery, squally, and unsettled generally; a clear sky was, however, experienced in most places at frequent intervals. The temperature was 4° above the mean for the time of year in the East and West, and 3° above in all other districts. Some rather high maximum readings were registered at the inland English stations on the 15th, the thermometer rising to 59° at Cambridge, 57° at Leicester, and to 55° in several other places. No very low minima were observed, and scarcely any frost occurred. The wind until the 20th was generally south-westerly, but by the 21st it had shifted to W., by the 22d to N., and continued to blow from the last-named point (except in Scotland) during the remainder of the period. The south-westerly currents varied in force from a strong breeze to a gale on nearly all our coasts, but the westerly wind was generally moderate or fresh, and the westerly current light in all parts of the country. The rainfall was slightly less than the mean in "Ireland, N.," equal to it in "Scotland, W.," but rather more than the mean in all other districts. Smart showers of hail fell over the south-eastern counties between the 20th and 23d.

JAPANESE CONIFERS.—IX.

(Continued from p. 233.)

ABIES (Picea, Hort. Angl.) VEITCHII.\*—Two or three plants, as we have already had occasion to remark, are called Abies or Picea Veitchii in the nurseries, which have no claim to such an appellation. Messrs. Veitch alone, so far as we know, are the happy possessors of living plants of this beautiful and very interesting Silver Fir. As modern botanists do not seem inclined (as we certainly are not) to follow Parlature in "lumping" into one genus Pines and Spruces, Silvers and Larches, Cedars and Hemlocks, the name Veitchii may happily be retained for "this most remarkable species," which was described by Lindley under Abies, and not under Picea as supposed by Carrière. "I have named it," says Dr. Lindley, "after Mr. J. G. Veitch, whose great merit as a very energetic explorer of the-vegetation of Japan it gratefully records." We should have been grieved to have had to disturb this arrangement, and are proportionately pleased to be able to retain in connection with so beautiful a species the name of its discoverer.

The plant has been well described from dried specimens by Murray (loc. cit.), and our figure (fig. 50) will suffice to convey an idea of its appearance; so that all that it seems necessary to add now is the account of the male inflorescence which is present in some of Mr. Maries' specimens, and which has not previously been observed.

Male catkins about 1/4 inch long, raised on a stipes of equal length emerging from a scaly bud, the bud in question springing from the wood of the second year; anthers stalked, connective developed into a saddle-shaped flap, from the back of which projects a horizontally spreading or deflexed spur-like process. (Fig. 50.)

The disposition of the resin canals in the midst of the ground tissue of the leaf as in A. brachyphylla (see

FIG. 51.—ANTHERS OF ABIES VEITCHII, SEEN FROM THE BACK, FRONT, AND SIDE.

p. 557, vol. xii.), has been well described and figured by MacNab, and is in itself sufficient to distinguish the present species from A. homolepis (p. 823, vol. xii.), which in gardens has been mistaken for it. But the dense elegant feathery foliage, the blunt emarginate rarely acute leaves, the small erect obtuse cylindrical cones with concealed bracts, and the deeply falcate scales, all serve to render this species easily recognisable. Mr. Maries speaks of a green-coned variety and of a purple-coned variety, but this may possibly be an affair of age, season, or locality.

Schmidt, as we have seen (p. 589), considers A. sachalinensis to be a variety of this species, but if the reader will turn to the figure of that form as given at p. 589 of the present volume, he will, we think, agree with us in considering that, for garden purposes at least, the two are quite distinct, and Mr. Maries assures us that the two trees are widely different in habit and appearance, and in the length of the leaves. A. sachalinensis is a lowland tree, growing not only in Sachalin, but also on the south-east coast of Jesso, while A. Veitchii occurs on the central mountains of Japan rarely below 5000—6000 feet. It should, however, be said, that we have seen cones of A. sachalinensis from Mr. Maries since we saw those figured at p. 589, and that these cones, in form and in the degree of prominence of the bracts, offer intermediate stages between true Veitchii, in which the bracts are all shorter than, and therefore concealed by the scales, and true sachalinensis, in which the bracts are

all prominent. The leaves of the young sterile branches of Veitchii are much longer and more slender than those on the cone-bearing branches, and hence resemble those of sachalinensis. While, therefore, for garden purposes we keep the two species distinct, we shall not quarrel with those botanists who regard the one as a variation from the other. If Maximowicz's nephrolepis be, as we believe from a comparison of the types that it is, the same as Veitchii, then the species in a wide sense has a rather extended range, from Sachalin to Yesso, Japan, and the mainland of Manchuria. M. T. M.

Home Correspondence.

Wild Violets.—Few people would think that they could have too many sweet Violets about their grounds if they could have them without interfering with other flowers. There are many parts of the country in which Violets do not grow wild, or where the competition for the few which grow is such that it is difficult to get two or three in the scramble for them. Those who come to a new garden, if fond of Violets, generally plant some in their flower-beds, and assign perhaps a piece of rich deep soil in the kitchen garden to them. After flowering the first year they become an untidy luxuriant mass of leaves, bearing few or no flowers, and it is decided that the soil does not suit Violets. But observe where and how wild Violets grow and flower best, and you will perhaps see that the bank on which in March you gathered a bunch of fine Violets is in May a mass of the umbelliferous weed called Cow Parsley, or, still more likely, a luxuriant bed of Nettles. Violets do best where they have to compete with such plants as these for soil, and where they cannot grow thick, but have to creep about to look for a vacant spot amongst the shelter of taller vegetation. So dig up your thickly matted Violet roots in September, and plant a few where they were, to flower and increase again, and take the rest in baskets to plant on orchard banks, in corners under deciduous trees, near rubbish heaps, under Privet hedges, behind walls where Nettles grow; in fact, in any bit of waste ground you can find. Every country house has too many such spots. Where they become too luxuriant, thin them out again, and look for other places. In this way you may always have abundance of Violets in spring. C. Wolley Dod, Grange-over-Sands, Lancashire, February 24.

Cheshunt Hybrid Rose.—The committee of the National Rose Society has deemed it expedient to make a rule that this Rose shall no longer be shown in a box of Teas. Now what does this rule signify? It simply excludes the Rose Cheshunt Hybrid from being exhibited, except in a very rare case, in any box of Roses whatever, and this I think I can prove. It is with the rarest exception that you can exhibit Cheshunt Hybrid among twenty-four or thirty-six H.P.'s, for this reason, that when the Rose is large it generally becomes rough and coarse in the centre (although I have seen it exhibited with form equal to Alfred Colomb), and it is therefore useless in a collection of H.P.'s. Again, you cannot exhibit the Rose in the class to which it belongs by birth, viz., Hybrid Tea, because there is no such class at present, and even if there was there are not a sufficient number of Roses of this sort to make one. Perhaps we may have a class for these in time to come, when the Stapleford Roses and others are in the hands of the public; but this cannot be yet. Now why has this Rose been excluded from the Tea box? Because, as far as I can gather (and I have spoken to several nurserymen exhibitors of the Rose about it, as well as amateurs), certain gentlemen, supposed to be learned in Rose lore, do not like the Rose—i.e., they do not like to see it in a box of Teas—they say "its colour spoils the tout ensemble of the Tea box." Now a great many people, and I think I am right in saying the bulk of exhibitors, think just the contrary—that the beautiful colour of Cheshunt Hybrid, in half-opened bud, not only sets off the other Teas, but is in itself a lovely Rose. I remember standing by a gentleman at one of the great Rose shows this last year, when he exclaimed, "What a lovely box of Teas, only it is utterly spoiled by Cheshunt Hybrid." I feel confident in my own mind it was Cheshunt Hybrid that made the box "lovely;" for if it had been removed the box would have presented only one colour, or shades of one colour. I think—and many others think with me—that the committee have taken a leap in the dark; at any rate they might have waited till there were a sufficient number of hybrid Teas to form a class of their own before they cut off all chance of poor Cheshunt Hybrid seeing an exhibition tent again. Apart from exhibition this Rose is the most useful to have as a garden Rose—Gloire de Dijon always excepted. It is hardy, a profuse bloomer from early summer to late autumn; will

grow as a standard, or climb on a wall in any position, and always furnish Roses to cut. E. L. F.

Broccoli.—Your correspondent, Mr. H. S. James, has drawn attention to a question of much importance to gardeners. Broccoli are literally cut to pieces here as elsewhere, and their loss will be severely felt this season, on account of the late supply of Cauliflowers being so soon cut off last November. At a rough guess, I should say that many gardens will be short of this much valued esculent for a period approaching six months during the present year. I am, however, astonished to find that Mr. James attaches so much importance to varieties. I have long ceased to notice the elaborate lists of things that differ little except in name to be found in trade catalogues. Those long lists and the pretty pictures that we so frequently see, are surely not intended to catch practical gardeners. I think climate, soil, situation, and the distance at which the plants are kept apart has more to do with the preservation of green crops than any advantage that is to be obtained from cultivating particular varieties. At the same time I do not ignore the hardness of some kinds over others. Veitch's Self-protecting Broccoli has failed here as with Mr. James, but, generally speaking, we manure our ground too much, and for want of space plant out too thickly; the result being, that in a season like the past one our good intentions perish with the plants. It would be a great boon to gardeners, and an advantage to employers, if it were a recognised custom to have an auxiliary garden for rough vegetables minus the brick walls. The original cause of having kitchen gardens so inadequate in extent, was no doubt owing to the cost of walls. I am not so certain but that Brussels Sprouts, Broccoli, and other greens, would succeed better in spare gardens properly enclosed than they do within the precincts of brick walls. I am of course referring to gardens of inadequate size, where thick planting is practised as an absolute necessity. In low districts and in all damp situations I would prefer any open plot protected from cattle and vermin, such as hares and rabbits, for planting winter crops, with a view to their withstanding severe frost. We have two examples bearing upon the point before us. There are two plantations of Broccoli within the kitchen garden proper—one is an open quarter, the other occupies an east border; the soil is deep and highly enriched in both cases, but the plants, as may be expected, have escaped the severity of the weather much better in the open brake. We have a third plantation outside the walled-in garden, in a poorer soil, which has escaped still better, proving how advantageous it is to make provision against contingencies that are always possible and never improbable. I have abundance of private communications from well-known practical friends bewailing the sad loss of vegetable crops. Why cannot we exchange experiences and opinions in your columns for the benefit of ourselves and others? W. Hinds, Canford, Dorset.

I have this season grown six varieties of Broccoli, and about 1500 plants in all, made up of Veitch's Self-protecting Autumn, Veitch's strain of Wilcox's Late White, Penzance Early White, Osborn's Winter White, Model, and Sutton's Perfection. Veitch's Self-protecting were grown in a south border, and although they failed in the autumn to come into use owing to the early and severe frosts, they have stood the severe frosts very well and have begun coming into use. Veitch's strain of Wilcox's Late White has stood very well, having lost about an average of two or three in twenty-five plants—also about the same with Penzance and Model. Osborn's Winter White has also stood the test well, losing about two in thirty plants; they are beginning to come in now. It is a Broccoli which deserves a place in every garden, while Sutton's Self-protecting Broccoli is rightly named, as my loss is about one in thirty. They are planted in the most exposed part of the garden, and are the least injured. I have heard this season of large breadths of Broccoli being killed to the ground in gardens near Norwich, thus showing the severity of this winter in the Eastern Counties. J. Clarke, Gr., Melton Constable.

Badly Ripened Seeds.—Those of us who have to cater for London families, and who are expected to have a supply of early forced vegetables, are already experiencing some of the disappointments that a good many anticipated, and that the trade forewarned us against, as the result of the past sunless summer. What I refer to particularly in this instance is a clear case of French Beans refusing to germinate, no matter under what conditions they are tried. I have tried them in pots, pans, boxes, &c., selecting soil in capital condition that was neither too wet nor too dry, placing the vessels containing the seeds in various temperatures—but all to no avail, as three-fourths of, and in some cases all, the seeds turned quite soft in the soil. Driven to extremities I was at last induced to try a few seeds of a well known early kind procured from a friend, of his "own sowing," and every seed grew in a few days. The seeds

\* (1861) ABIES VEITCHII, Lindley, Gard. Chron. 1861, p. 23; Murray, Pines and Firs of Japan, 1863, p. 39, figs. 1; Carrière, Traité des Conif. ed. 2 (1867), p. 39; Koch, Dendrologie, 2, 228 (1873); Franchet and Savatier, Enum. Plant. Jap. n. 1, 468 (1875); Picea Veitchii, Gordon, Pinetum, ed. 2, 226 (1875); A. nephrolepis, Maximowicz, Mel. Biol. 6, 22 (1866); A. sibirica var. nephrolepis, Trautvetter, ex Maximowicz, Primit. Flor. Amurens. 265 (1859); Pinus selenolepis, Parlature in DC. Prod. xvi., ii., p. 427 (1868); Pinus Veitchii, MacNab, Proc. Roy. Irish Acad. 1876, p. 687; Hab.—In ins. Nippon, Fusi-Yama, ad alt. 6000—7000 ped., J. G. Veitch; Oldham 813; Maries! Hakodate, uli cula, Maximowicz! Her secund. Mandshuria austro-orient, Maximowicz! Ins. Sachalin, Schmidt!

were given to me for the purpose of growing them in order to work up a stock of the variety for forcing purposes, and upon learning my straitened position the same kind friend sent a second contribution to the "relief fund," which was gratefully acknowledged and gladly accepted. My friend has retained this variety for years and saves his own seed annually. I saw the plants in bearing last year, they were grown in deep boxes in a warm orchard-house with a south aspect. In future I am going to borrow a leaf out of my friend's book, and grow and ripen my own seed thoroughly. It is an old proverb that "Heaven helps those who help themselves," and I for one am resolved to act upon the old adage in all cases where it is practicable. *Cultivator*.

**The Chinese Primrose.**—The value of this plant as a winter flowering subject has been well brought out at Castle Wemyss, the residence of John Burns, Esq., during the past season. The plants occupy a low span-roofed house used for Strawberry growing in spring; they are grown in 6-inch pots, and average 18 inches through the mass of bloom, forming perfect cones resting on stout, healthy-looking foliage: the cutting from these plants has been immense, and "still they come." I trust Mr. Henderson, the well-known superintendent of these celebrated gardens, will oblige his gardening friends by detailing his mode of producing such extraordinary results in so short a time, as I was told they were only sown in March last year. *Greenhorn*.

**Odontoglossum crispum.**—The article on *Odontoglossum vexillarium* by Mr. Sanders was very interesting, and he would increase the gratitude of Orchid growers by a similar notice of *Odontoglossum crispum*. The earlier specimens were much finer than the later importations, which are more stellate than round. The finest varieties I have seen came from Pacho, and I should be glad to learn if the districts where the varieties of *Alexandra* and *Bluntii* grow have any special characteristics. *H. E. C.*

**Birds and Primroses.**—I observe the charge has been again raised against the small birds, that they tear the flowers of Primroses to pieces out of sheer wanton mischief. Those who make this charge can hardly realise how much it involves. We credit birds with eating seeds, fruit, or corn, from an instinctive desire to satisfy hunger—in fact, to live. In admitting this, no one puts birds into the category of reasoning beings—they are simply obeying natural instincts; but to assert that birds can be guilty of wanton mischief, is undoubtedly to assume that birds do reason, and have an intelligent conception of that which is right and wrong, or else how can it be realised that they know they are doing mischief and take delight in doing it? If it affords them wanton pleasure to destroy Primrose blooms that lords of the creation may be plagued, why do they not also destroy Snowdrops, Daisies, Violets, and indeed all other early spring flowers. The real culprits are the chaffinches—surnamed chaff, I suppose, because, on the hypothesis laid down, they love to "chaff" humanity. These are early risers, and usually attack the Primrose blooms in the early morn when the dew is on the flowers, and when the honeyed nectar they contain is of the sweetest. That they seek either for this honey when destroying the flowers, or else for some minute insects that infest them, there can be little doubt; or if for neither of these purposes, then the birds eat the flowers as food. It is not "wanton mischief," but the need of food that causes them to attack seed-beds, and in the same way it is searching for insects that infest the large flowers of the African Marigolds that induces the sparrows to pull the blooms to pieces, and scatter the petals all over the ground. If this were done out of sheer mischief, why not serve Asters the same? Troublesome as birds may be, I don't regard them as wantonly mischievous, and feel assured that what they do in gardens they do solely guided by Nature's instincts. *A. D.*

**Tree Pæony.**—I fear I have not made the matter of grafting the Moutan Pæony sufficiently plain to Mr. Brotherston. No doubt it may be grafted on any variety or species of herbaceous Pæony, or indeed even on the Moutan itself; but the stock I alluded to was particularly suitable for the purpose, owing to the number and size of its tubers, and was preferred to everything else by the Chinese. I may take this opportunity of making a remark or two upon the hardness of the Moutan Pæony. I believe Lord Haddington need have no fear on this point. It is perfectly hardy in England. Like many Oriental plants, it is liable to get injured in its early spring growths. Our English climate is much more variable and uncertain than either that of China on the east or America on the west. We have a few fine days of spring weather, then winter once more. Our Oriental plants are not accustomed to this—they get deceived, and burst into leaf and bloom, and hence Mr. Brotherston's remark that "the points of the shoots

die back a few inches every year." There is only one remedy, and that is, we must give a slight protection in the spring until all fears of spring frosts are past. Otherwise the Tree Pæony is perfectly hardy in England. *Robert Fortune*.

— On the lawn in the south front of the conservatory at Froyal, Footscray, Kent, were, in days bygone and probably are still growing, two nice specimens of this shrubby plant, which received no protection whatever during the winter months, neither did they require it—judging from the satisfactory results which followed each succeeding winter. These plants formed very prominent objects of floral beauty—their greyish rugged stems, the size, brilliancy, and beauty of the blossoms rendering them noteworthy subjects in the well-kept grounds, which, I may be permitted to remark in passing, have, under the superintendence of Mr. Marsh, been considerably improved within the last ten or eleven years. The Cedars of Lebanon here (not excepting those at Wilton House, Salisbury) are perhaps the finest in the kingdom, and, for all I know, are still in a fine state of preservation. *H. W. H.*

— It may be interesting to many of your readers to know, that some fifteen years ago I bought for a large sum of money the two most renowned varieties of Tree Pæonies, viz., *Gloria Belgarum* and *Souvenir de Gand*, of the late Mr. Charles Gauthals. At that time I grafted about 1500 of these on the roots of the common Tree Pæony, by far the best and most suitable stock for the purpose; but since then I have grafted the Tree Pæonies on the roots of all the herbaceous species without exception, and with most satisfactory results. Nevertheless the *P. sinensis* of the herbaceous class is to be preferred, because it is not liable to produce so many suckers as *P. officinalis* edulis, &c. The best time for grafting is July and August. In 1849 the late Dr. Siebold confided to my care the whole collection of Tree Pæonies which he introduced, for propagating, which I did on all the species of the herbaceous class with the greatest success. As to the hardness of the Tree Pæonies I may state, that while many plants in the open ground, such as Roses, Rhododendrons, fruit trees, Conifers, &c., were killed by the severe frost we had this winter, all my Tree Pæonies had no protection whatever, yet they suffered not in any way—they are, in fact, at the present moment in bud. In my opinion they do not suffer so much from a severe winter frost as they do from the late spring frosts in April and May. *Joseph Baumann, Nurseryman, Ghent, Belgium*.

**Hemerocallis flava as a Winter-blooming Plant.**—I have had this Lily in bloom for the last fortnight, with as many as from nine to eleven spikes on some plants, and from six to seven blooms on a spike. I would strongly recommend it as a winter-blooming plant, being so easily grown, the perfume so sweet, and the colour such an acquisition. I have grown it for the last three years, and I am well pleased with it. It is no mean object in a conservatory, and stands the same treatment as *Leucojum aestivum*, which I have also in bloom. *John Clew, Headfort Gardens, Kells*.

**An Amateur's Experience.**—I am surprised to find how few axioms have been laid down for the guidance of cultivators of Peaches under glass. This must have been practised for generations, and yet some of the most simple problems appear unsolved. (1.) The question of whether galvanised wire will injure the growing shoots of Peaches to me is so well established by my own experience that I should have supposed it unquestionable had not the question been lately discussed in your columns. For my own part, so regular was the result in my house that I have been used, where a shoot pressed against the wire, to put a bit of matting to prevent it from injuring the bark, and as I have a long range of wire, I was induced last year to untie the trees from the wires, and have them well painted. The result is a perfect cure. (2.) I see questions respecting the scale insect also on Peach trees, Pines, &c. I have proved the mixture of one wineglassful of paraffin or petroleum oil to 4 gallons of water, thoroughly mixed up before using, on Peach and Plum trees, as I wrote last year, and this year confirms it also. Paraffin oil is also a cure for mealy-bug, especially when used as an ointment mixed with its own bulk of kitchen fat. The latter should however be cautiously used, not spread over the whole plant. The paraffin and water will not hurt bedding plants. In my orchard-house, 14 feet by 24 feet, I syringe every inch, using 12 gallons: not a plant injured. (3.) I have a plague of ants. I have long suspected them of planting colonies of black and green-fly to serve as "milk cows" for them, but could never catch any one in the act. To-day, however, I found an ant carrying an aphid in his mandibles up a Peach tree. This is an interesting fact: can any of your readers confirm it by their observation or give me a recipe to clear the house of these industrious mischief-makers? Their nest is at the root of one my best Peach trees—

a difficult place to disturb. (4.) I have had a plague of green caterpillars, under an inch long, which I do not know how to abate; for the last two years they have bred in great numbers. The first year on one Nectarine tree I had nearly 100 fruit spoiled by their ravages; last year I had them picked off by hand. I shall be much obliged if some of your experienced friends will help an amateur grower with their advice. I have succeeded admirably in procuring the setting of large numbers of fruit, but fear to become too tedious if I write farther as to ventilation, syringing, &c. *M. W. Rowlett, Leicester, Feb. 23.*

**Myrsiphyllum asparagoides.**—This plant in my estimation is worthy of a place in every greenhouse or conservatory on account of the delightful Jasmine-like fragrance of its tiny white flowers, which are borne in great profusion. A small plant of it, when in flower, quite charges the air with its most delicate and agreeable perfume; its little dark shining leaves, when trained to wires either on pillars or on back walls of conservatories, also give a very pleasing contrast to its miniature-like blossoms; thus adding a twofold charm to recommend it. *E. Morgan, The Butts, Harrow-on-the-Hill*.

**Peach Trees and Galvanised Wire.**—I substituted galvanised wire for nails and shreds in a Peach-house we have here, 75 feet long, the wall 14 feet high. A trellis was put up also in front of the house, and the same kind of wire used. Last year I do not think there were more than half-a-dozen cases of injury to the shoots, and those were traced to the ligature being too tight. The wires on the wall were covered with the limewash used at our annual cleansing of the wall. Those on the front trellis received two coats of paint in the first instance, and one coat at the annual winter pruning and tying. Treated so I do not think it possible that any injury can result from the use of the wires, provided the ligatures are tied with a view to the swelling of the wood. The correspondence relating to this subject which has appeared in your columns from time to time has proved that coating the wire with paint or limewash is in great measure a preventive of the injury, if any, caused by using galvanised wire. So small is the expense and the time required, that where trees are subject to injury in the manner above referred to, I should most certainly advocate the above remedy. Far from adopting the return to nails and shreds for walls, as a former correspondent of yours had decided to do, I should be very glad to have all my walls wired. The neat appearance, the expeditious manner with which the training can be effected, and—a great consideration—the preservation of the walls, are obvious reasons for so doing. In the case of Pears, Plums, &c., trained on the spur system, eyes only driven into the wall, as recommended by Mr. Maclean, of Beanmanor, is a very good plan, but for Peach trees wiring is preferable. *D. C. P.*

**Wire-training of Wall Trees.**—Several of your correspondents have complained of their trees being injured by canker, &c., owing to the training on wires. I have now tried it many years, and since the first, when I suffered in like manner, I have never had a complaint. It is, of course, easier and more natural for a gardener to tie his knot tight, but in doing so he brings the young shoot into immediate contact with the wire, by which the tender bark is bruised and pinched, and probably chilled by the cold iron. I at once tried a very simple remedy, which has answered perfectly. Let the twine or bast first be tied to the wire by a half hitch, and then round the shoot, taking care to leave plenty of room for growth. If this is carefully attended to, there will, I believe, be little danger of canker, nor any necessity for painting the wire, which will not meet the real danger. *Experio crede. T. P., Porthgwillden*.

**Catalpa.**—The quality of being durable belongs to others of this genus besides *C. bignonioides*. *C. longissima* has long been known in the West Indies as a wood to which the property belongs in an eminent degree. It is much cultivated and eagerly sought after for posts, &c. It is also a wood which does not suffer from the attacks of ants so much as many others. It grows to 60 and 70 feet in height on the plains, and grows well in the same soil as required by *Pithecolobium saman*. *J. H.*

**The Frost and the Shrubs.**—Of about a hundred species of Conifers none have suffered here except a *Podocarpus andina* (*Prumnopitys elegans*) in a bleak situation; the tender specimens of *Pinus insignis* having been killed off some years since, the two survivors appear able to stand anything. *Tacrydium Franklinii* and *Libocedrus Doniana* and tetragona are the only Conifers which have utterly failed with me, and the last I have not given a fair trial to. *Sciadopitys* lives, but does not progress; perhaps, however, I may not have given it fair play. *Solanum jasminoides* was killed last winter, *Grevillea rosemarinifolia*

succumbed to the severe spring of four years since, and I have failed to keep *Embotrium coccineum*, although I cannot help thinking that if the climate of Ushnia (Cape Horn) is as severe as it is stated to be, the species or variety there found ought to be hardy. The Rev. T. Bridges, of the South American Mission, is now in England, and might be able to give some valuable information, also as to the ever-green shrub known there as *Leña dura* (sp. hard-wood). *Fagus betuloides* is quite hardy, and I am surprised that it is not more commonly met with. *Desfontainea* has not suffered where once established, but that appears to be the difficulty. *Raphiolepis ovata* appears to be perfectly hardy. I have utterly failed with Fortune's Palm, although at Dangstein there is a fine specimen; probably there is some art in protecting things during the winter. The same may account for the *Fuchsia* given me by the late Mr. Tillery being always killed down, although our sunny Sussex slope must be far warmer than Nottinghamshire. *Ceanothus divaricatus* (standard) was much cut last year, but did not suffer against a wall; but it is a most valuable shrub. Whether the Myrtles will break out after a second killing back it is impossible to say, but I am anxious about them, for it is too much to expect such continued vitality. *Sussex*.

**Cedrus atlantica.**—Was this plant known to the Romans? In the postscript of a letter from J. Evelyn to Samuel Pepys, dated Sayes Court, August 7, 1683, there occurs the following passage relative to Lord Dartmouth's expedition to Tangiers:—

"I am sure you cannot but be curious (among other things) to enquire of medals and inscriptions, especially what may be found about old Tangier, &c. Mr. Sheeres will remember also the poor Gardener, if he happen on any kernels or seeds of such trees or plants (especially ever-greens) as grow about those precincts. Were it not possible to discover whether any of those *Citrius*-trees are yet to be found, that of old grew about the foote of Mount Atlas not far from Tingis, and were heretofore in deliciis for their politure and natural maculations to that degree, as to be sold for their weight in gold? Cicero had a table that cost him ten thousand sesterces, and another, which I have read of that was valued at 140,000 H.S., which at 3*l.* H.S. amounted to a pretty sum; and one of the Ptolomies had yet another of far greater price, inasmuch as when they used to reproach their wives for their luxury and excess in pearly and paint, they would retort and turn the tables on their husbands. Now for that some copies in Pliny read *cedria*, others *citria*, 't would be enquired what sort of Cedar (if any) grows about that mountaine."

On referring to Dr. Middleton's *Life of Cicero*, I find—"There was a Cedar table of his remaining in Pliny's time, said to be the first which was ever seen in Rome, and to have cost him £80." "Extat hodie M. Ciceronis in illa paupertate et quod magis mirum est, illo ævo empta H.S. x. [Plin. *Hist. Nat.*, xiii. 15] nullius ante Ciceronianam vetustior memoria est." *Ibid.* 16. Was the wood referred to Cedar? and if so, was it *Cedrus Libani*, *C. atlantica*, or *C. Deodara*? *S. P. Oliver, Capt.* [One such table was valued at about £9000, while still more fabulous prices are recorded as having been paid for them. Horace suggested the employment of the wood in the construction of a temple to enshrine a marble statue of Venus:—

"Albanus prope te lacus  
Ponet marmorean sub trabe citrea."

and Petronius Arbiter, in descending on the luxury of the Romans, seems to represent it as worth more than its weight in gold. Daubeny, from whose essay on the trees and shrubs of the ancients we take the above, concludes that the tree which furnished this material was what is now known as *Thuya articulata* or *Callitris quadrivalis*, a tree which is found at present in Algeria, and which furnished beautiful specimens of cabinet work to one of the great exhibitions (1855) in Paris. *EDS.*]

**The Hermitage, Higham.**—This ancient seat of the Head family was rebuilt by Sir Francis Head, Bart., who enclosed a park round the same, and greatly improved the adjoining grounds. When the mansion was rebuilt as above stated, the interior was decorated by Italians brought over expressly for the purpose. The result is that some of the reception rooms, notably the domed dining hall, remind the visitor of such rooms as are commonly to be found in the noble palaces of Milan and other Italian cities, the plaster decorations of classic subjects and garlands corresponding with those to be found in Italy. From the Head family the property passed into the hands of a yeoman farmer, who for many years lived there and tilled the soil. During his occupation the park was ploughed up, the ball-room of the mansion was converted into a granary, and the maintenance of the house much neglected. At his death, after many changes of occupants, it passed into the hands of the present proprietor, who purchased it in 1866, reclaimed a portion of the park and laid it out to great advantage. He also renovated and completely reinstated the mansion, laid out the terraced gardens with great effect under the superintendence of Messrs.

Veitch of Chelsea, and added a fine vinery with stove-house adjoining, and two smaller glass structures, and planted the ball-room, now reconverted from a granary into a noble conservatory, and in which are placed fine specimens of Tree Ferns and Palms, now in full development. The soil and climate of this part of Kent are most favoured. Here flourish the Fig tree and Myrtle without protection, while such plants as *Rambusa gracilis*, *Elaeagnus reflexus*, and *Arundo conspicua* grow luxuriantly without protection, unaffected by frosts. The nature of the soil is a rich sandy loam on a chalk foundation. It is said that in former times vineyards were successfully cultivated in this part of Kent, where the Hop grows luxuriantly, and the magnificent growth of *Rhododendrons* at Cobham Park in the immediate vicinity testifies to the mildness of the climate. *Higham*.

**A Novel Cineraria.**—Lovers of this showy and extremely useful florists' flower will be pleased to learn that Mr. James has succeeded in obtaining a new "break," that promises to be the forerunner of another host of new flowers. The colours of the flower, as will be seen in the annexed illustration (fig. 52), do not shade off into one another, as is usually the case, but are arranged in bold and well-defined belts, the outer one being of the darkest shade—a rich deep maroon. The flower is well recurved, and also possesses other qualities in size and substance. We understand that it flowered for the first time last season, and that it has reproduced

FIG. 52.—A NEW TYPE OF CINERARIA.

itself from seed. It is now in bloom at Redlees, and we hope will be exhibited at one or other of the forthcoming shows.

**Art in the Conservatory: Heating.**—Mr. Adams, at p. 181, in defending his views on heating, materially alters his rule, for example at p. 106, when he says "26° is low enough for ordinary calculations" (p. 181). Let us see how his vinery of 400 feet at p. 106 stands. I find it requires 92 feet of piping; so far so good, but how does it stand in practice? Our vineries contain 72 feet to every 400 feet of external glass, that is 20 feet less than Mr. Adams' vinery at p. 106. Now this is the point, for the 20 feet more piping he has to raise his house of 400 feet 20° to justify his rule of calculation, and I say it cannot be done. Two years since we put in about 60 feet of 3-inch pipe, to raise a house 10°, and find it works easily in mild weather, but only just able to do the work in rough weather. Mr. Adams has put another rule at p. 181, but I cannot see how it can be worked in practice, because, as I think, the water in pipes (180°) is too hot, according to outside temperature (32°). Now, suppose piping is put into a house that will give a proper temperature with pipes at 180°, and outside at 32°, what heat will be required in the pipes to keep up the temperature of the house when outside is only 20°? I find 32 : 180 :: 20 : 112½ nearly. Who can bank up at, say, 12 o'clock at night, and come at 5 o'clock in the morning and find the water boiling in pipes perhaps 50 yards from the boiler with the outside temperature at 20°? If these are the standard rules on heating, I am sorry I am unable to agree with them, because I think if the highest temperature is given to pipes, the average lowest temperature should be given to the external air. In working the rule given at p. 106, this plan would suit the South of England or the North of Scotland, or any other country, giving different quantities in different climates. This is the conclusion I have arrived at, and shall adopt it to suit my own requirements until I hear of a rule which will act better. *Charles Ford, Thornton Manor Gardens.*

## Foreign Correspondence.

**GARDENING AT OPORTO.**—Oporto, whence I write and where I have my abode, is, as can be seen from a map, nearly in the latitude of New York, Rome, Constantinople, and Peking; but from a gardening point of view, and even from the point of view of human comfort, climate is not so much an affair of latitude as of a host of other conditions. We have a far warmer winter than any of the places I have named, not even excepting Rome. For many years together I have only seen it snow once, and then the flakes melted as they touched the ground, and though we have frost there is almost invariably a thaw before the sun has been in the heavens two hours. All through the long continued cold weather of last December and January, which seems to have prevailed over the whole of Europe, my registering thermometer has but once marked a lower point than 30° Fahr., and that was on Sunday night, January 24, when the register mark showed 29°.

This may well seem a paradise for gardeners, in combination with an open, decomposed granite soil, but we have our drawbacks. The east wind which comes to us over the great peninsular table-land is cold and parching in winter, and in summer fiery in its heat and more parching still. In addition to these elemental disadvantages, we have to contend with such an army of sparrows, tits, and other feathered enemies, such hosts of slugs, snails, wire-worms, caterpillars, and aphides, and beyond all other ravagers of our parterres, such a cohort of mole crickets as few gardeners can elsewhere be plagued with. Again, throughout the summer very strong north-west winds prevail. On the whole, however, horticulturally, we have not very much to complain of. In such conditions we should do a great deal more than we achieve, but in truth scientific gardening and scientific gardeners are not common in this country. Whatever owners of gardens do in Portugal they must do or direct themselves. Portuguese gardeners are willing and handy, but extraordinarily ignorant of their craft. For my own part I admit that my successes are outnumbered by my failures, as often as I have travelled out of the common gardening routine; nevertheless, I have thought that the record of some of my experiments, carried out under conditions novel to English gardeners, might have an interest for at least some among your large circle of readers. I propose accordingly from time to time to give some account of my doings and their results.

We have now had, as I have said, over two months of keen, dry, frosty weather, and I never knew the gardens so bare of flowers at this period of the year. *Crocus* and *Narcissus*, indeed, are in bloom, and the scarlet *Star Anemone* (*fulgens*) and *Violets* and *Primroses* are in full swing; the *Camellia* trees are covered with blossom, but this blossom where exposed is sadly nipped and made yellow by the east wind; these, however, are no more than the common product of all Portuguese gardens in January.

As regards novelties, I have been greatly disappointed with the behaviour under my hands in this country of what was always my favourite winter flower in England, the old-fashioned *Christmas Rose* (*Helleborus niger*). Last spring I planted, under the most auspicious circumstances, some dozen strong clumps of *H. niger* and of other species of this genus, *fetidus*, *orientalis*, *ruber*, *purpurascens*, *lividus*, *viridis*, and others. Some have died, most have dwindled, and only one has thriven, the shrub-like *H. lividus*. I conclude that we are in too low a latitude. Most of the species of *Helleborus* have Northern or Central Europe given for their habitat. Much as I have travelled and often botanised in Portugal, I have never encountered a plant of the genus. I believe that neither our soil nor our aspect is to blame, for I have tried every soil, from stiff, loamy clay to sandy peat, and every aspect from north to south. Here, then, is the record of a decided failure. On the other hand, I have succeeded where I did not in the least expect success. I have had abundant blossom from white *Bouvardias* grown in the open air from July till past Christmas, and not small and stunted blossoms, but bloom that would pass muster in Covent Garden. This is to me the more extraordinary, as my garden, though protected from the north, is fully exposed to the east, and the east wind had accordingly blown upon my *Bouvardias* persistently for about a month without apparent harm. At about Christmas it got a little colder, and then I used shelter; the plants are at

this moment in a most promising condition. I shall leave them untouched till summer. Another plant which is now in most abundant flower is *Agathea amelloides*. I do not know much of it in England, but here it is quite hardy, and with its pretty blue and yellow Aster-like flower is by far the most ornamental and longest blooming plant in my garden.

I must not forget another novelty in Portugal, the Cape aquatic, *Aponogeton distachyon*. I saw it in magnificent flower in a pond in Surrey last June, and in September I brought over some roots and planted them in an ornamental stone tank. The soil was our common garden soil, about a foot deep, with 2 feet of water over the crown of the bulbs. In six weeks the floating leaves were visible at the surface; in a fortnight more the white waxen blossoms had opened, floating on the surface like little paper boats, and scenting the air around with their delicious fragrance. The tank is in no way protected from the cold winds, and yet the plants are now (February 15) in fuller bloom than they have been at all. Now this I admit surprises me even more than the blooming through the winter of the *Bouvardias*—for the wood of the *Bouvardias* was ripened in the growing period by the full heat of the Portuguese sun—but in the case of the *Aponogeton* there was of course no such heat, for they were planted on September 15. Your experienced readers know how well plants which have passed through a hot summer can stand cold. We have most signal evidence of this important fact over here. In England we see the *Heliotrope* turned brown by ever so slight a touch of frost; now here I have never known the *Heliotropes* to succumb to the 2°, 3°, or 4° of frost we are liable to. It is the same with *Dahlias* and with scarlet *Pelargoniums*. The natural blooming period of the *Dahlia* is indeed shorter than perhaps your English readers may have come to think, and the bloom fails quite as soon here as in England; but it is the exhaustion of the year's vital energy of the plant that causes its decay, no violence of frost, for often we have the thermometer considerably above 40° till Christmas. On the other hand, the scarlet *Pelargoniums* go on blooming, and finally seem to succumb more to wind than age or frost, carrying their scarlet standards, like maimed but sturdy veterans, well into the New Year.

In my next communication I propose to tell you something of the behaviour of the various species of *Iris*, native and foreign, in this latitude. *Theorist, Oporto, February 23.*

CASTLETON BOTANIC GARDENS, KINGSTON, JAMAICA: *Beaumontia grandiflora*.—One of the most conspicuous plants in the gardens here, at present, is *Beaumontia grandiflora*, growing as an ordinary shrub, 6 to 8 feet in height, and in full bloom. It grows in a flower border, but well isolated from other plants, and looking at it with its well balanced head and short-jointed well matured branches, terminated by a truss of large, bell-shaped, pure white flowers, the keenest observer would fail to discover that it was aught but an ordinary self-supported bush, instead of being, as it is in a natural state, one of the most vigorous climbers known.

There is here another plant of the same, which is growing about 9 feet from the stem of a large Mango tree. I am told that when it formed a bush, about 5 or 6 feet high, it flowered annually; but the then superintendent here, aware of its peculiarity, had a tall stake put in the ground near to it, and, intuitively I suppose, the arms of this plant embraced and clambered up the stake into the Mango tree, until now it has got to the top; but from the time that it began to climb it has not flowered.

Of course it will bloom in time, when by its further extension its terminal growth will no longer be supported by the Mango. It may serve to illustrate by its flowering in the shrub form, as well as in its non-flowering while in a climbing state, the value of self-reliance or independence, and botanically that rampant growth and the condition of blossoming are respective degrees of vitality or phases of vigour, the one almost the opposite of the other. *George Syme.*

CATANANCHE CERULEA.—This herbaceous plant is well fitted for pot-culture, and may be utilised for conservatory and room decoration. It should be potted in loam, leaf-mould, and manure, the pots plunged to the rim in a sunny situation, and well watered in hot weather, administering manure-water as soon as the pots get filled with roots. In this manner handsome specimens in 6-inch and 8-inch pots may be grown, which will prove very serviceable for decorative purposes. *J. C. B., in the "Field."*

Reports of Societies.

Edinburgh Botanical; Feb. 12.—The Society met in 5, St. Andrew Square, the President, Mr. William Gorrie, of Rait Lodge, in the chair. The following communications were made:—

I. On the Ripening of Hardy Fruits 150 years ago. By Mr. Malcolm Dunn, of Dalkeith Palace Gardens, Vice-President.

The paper was based on the old book exhibited at the last meeting, entitled *Pomona*, by Batty Langley, of Twickenham, 1724, and its object was to inquire how far the dates when hardy fruits ripened given by it when compared with such dates for 1879, and generally for the past three years, bore on the vexed question of the deterioration of our climate in these later times. Mr. Dunn had besides when composing his paper accepted and compared the evidence on the subject given in Miller's *Gardeners' Dictionary*, 1768; Martyn's *Gardeners' and Botanists' Dictionary*, 1807; Lindley's *Guide to the Orchard and Kitchen Garden*, 1831; Hogg's *Fruit Manual*, 1860 to 1875; and the *Herefordshire Pomona*, just being issued.

The *Pomona* discusses the growth of open-air plants giving the exact date when their fruits ripened at Twickenham and in the South of England. Thus, Langley describes nineteen sorts of Grapes then produced in England. From his very accurate accompanying engravings we recognise many also now grown, though under different names. A few of the hardier sorts, such as Burgundy and Claret Grapes, appear then to have been cultivated after a limited fashion in the open vineyard—a system, by the way, which Langley strongly advocates, though he concludes his dissertation on the Vine by saying that "a full south aspect on a wall is the best for all kinds of Grapes," clearly showing that then, as now, a crop of well ripened Grapes was with difficulty obtained from Vines growing in an open vineyard, even with a southern aspect in an unpropitious season; indeed some kinds were found so uncertain in ripening in any season that he recommends them to be grown as excellent fruit for baking when they failed for dessert purposes. Two-thirds of the sorts of Grapes enumerated by Langley are now grown; and we know that they will now also ripen their fruit as early and certainly when they meet with the same favourable cultural and climatic conditions. The white Sweetwater is mentioned to have ripened by August 21, as it now does in Southern England in ordinary seasons; so, too, our author notes November 10 when the white Raisin should be ripe, if, as he *naively* remarks, "the seasons are kind enough to allow it." So far then the dates of the ripening of Grapes given at Twickenham and around London 150 years ago are without change from those known in this latter half of the nineteenth century.

The records of the ripening of fruit trees, such as Peaches and Nectarines, bear also in this direction. Langley enumerates forty sorts of both, a majority of which are still in cultivation, and ripen about the same dates as he indicates. And so, too, with regard to Apples, Pears, Plums, Cherries, Apricots, and other fruits. They ripen now about the time given by Langley, and no change is indicated in the works already indicated as having been consulted, whose dates of publication nearly were intervals of thirty years—from 1768 to 1879.

Mr. Dunn attributed the decadence of outdoor cultivation of hardy fruits to the great extension of cultivation under glass, not to deteriorated seasons.

In the course of the discussion following this paper it was maintained that when proper care and culture is given, good orchard crops could be obtained even in such far northern spots, when naturally protected by tree or hill shade, as the vicinity of Cape Wrath, the Carse of Gowrie, or Cupar. The more extensive planting of hedgerows with fruit trees was advocated. Mr. A. Buchan, of the Scottish Meteorological Society, said that he had consulted other records, which showed the cycle of years from 1720 to 1730, referred to in the *Pomona*, was a succession of bad seasons; three of them, in fact—1726, 1727, and 1728—years of dearth about as bad as 1877 and 1879, with this difference, that in the former years there were no facilities for importing grain such as we now possess. About 1775 there occurred six or seven years of the very finest weather, such as there had been experienced no approach to except in 1826.

II. Mr. James Blaikie, F.R.S.E., one of Her Majesty's Inspectors of Schools, read an account of a visit to the Engadine, and exhibited a fine collection of nearly 300 alpine plants chiefly collected in that district.

The Engadine, or Upper Valley of the Inn, is situated in Eastern Switzerland. The upper part of the valley is nearly level, and is about 6000 feet above the sea. No corn is grown, and the only trees are the Arve (*Pinus Cembra*) and the Larch. In the lower Engadine corn grows freely, but Wheat will not ripen. The climate is dry, and the flora rich. Mr. Blaikie and his companion made Pontresina their headquarters during ten days' botanising. On the eastern side of the Pontresina valley the Piz Languard (10,700 feet) and other mountains offer climbing without either the attraction or the danger of ice, but they are clothed in many parts with a rich and varied flora. Less ambitious persons have only to cross the stream to enjoy shady walks where the banks under the trees are carpeted with the creeping stems and tender pink-lined cups of the *Linnaea borealis*. Ascending the Pizot, a superb granite pyramid 10,650 feet above the sea, the tourists found it particularly rich in Saxifragas; the specimens shown included *Saxifraga stenopetala*, *S. Sequiera*, and *S. planifolia*—plants only found in the highest Alps. A large portion of the collection was from the Val del Fain, a limestone valley near the

summit of the Bernina Pass, and celebrated for its alpine flowers. These included *Papaver alpinum*, *Alpine recurva*, *Cardamine alpina*, *Draba tomentosa*, *Eritrichium nanum*, *Phyteuma hemisphaericum*, *P. pauciflorum*, *P. humile*, *Sempervivum Wulfeni* and *S. Braunii*. Very frequent changes of paper helped to preserve the natural colours of the plants. With great difficulty one specimen of *Dryas octopetala* was induced to remain white, though the *Campanulas* were obstinate to the last.

III. A letter to Professor Balfour from Mr. John Buchanan, Mount Yomba, Central Africa, was communicated by Mr. Sadler.

This locality is midway betwixt the Zambesi and Shire Rivers, and is about 50 miles from Lake Shirwa, which the natives state was in October last little better than a sheet of mud owing to the aridity of the season. The district much resembles the Blantyre Mission station, where Mr. Buchanan was previously located. Maize is not so extensively cultivated, but Rice is grown, as well as a species of *Sorghum*, likewise Cassava, Bananas, and Plantains. Several species of Palms grow on the mountains, one of them Mr. Buchanan thinks is the wild Date; also very fine Tree Ferns—one of them is 8 feet high, having a spread of fronds of at least 20 feet in diameter. The natives use cord for net-making apparently made from fibres of *Hibiscus cannabinus*. They cultivate a species of *Croton*, with oil from which they anoint their bodies, without any of the effects on the system peculiar to *Croton tiglium*.

IV. Mr. Sadler gave in his report for January of the open-air vegetation at the Royal Botanic Garden.

V. Miscellaneous Communications.—A notice of the death of General Munro, C.B., a non-resident member of the Society, was laid on the table.

Mr. Symington Grieve gave in a note on the Island of Colonsay as a station for *Orchis pyramidalis*, which is not known to exist in any other part of the West of Scotland. Dr. Lightfoot, in his *Flora Scotica*, published in 1777, noticed this station, but this has been generally questioned, though Mr. Grieve could now confirm it, after the lapse of a hundred years since its first discovery.

Mr. John Stewart, W.S., exhibited some beautiful American Apples, which had been extensively sold in the British fruit market as Newton Pippins. The Apples, though of excellent flavour, were certainly not correctly named.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, FEBRUARY 25, 1880.

- Feb. 19.—A changeable day, fine at times, then dull and showery. Strong wind. Mild.
- 20.—Fine and bright till 4 P.M., dull after. Slight showers between 1 and 2 P.M. Rain and hail in evening.
- 21.—A fine day, partially cloudy. Heavy shower at 4 P.M. Cloudless afterwards.
- 22.—Fine till 10 A.M., very dark and gloomy till 2 P.M., fine afterwards. Heavy rain and hail at 11 P.M.
- 23.—A dull, miserable, cold day. Rain fell throughout.
- 24.—Overcast, dull and cold throughout. Fine towards midnight.
- 25.—A very fine bright day. Cold in morning, but warmer in afternoon. Cloudy at night.

LONDON: *Barometer*.—During the week ending Saturday, February 21, in the vicinity of London the reading of the barometer at the level of the sea decreased from 29.88 inches at the beginning of the week to 28.99 inches by the afternoon of the 16th; increased to 29.08 inches by the evening of the same day; decreased to 28.83 inches by the early morning of the 17th; increased to 29.44 inches by the afternoon of the 18th; decreased to 29.33 inches by the morning of the 19th; and increased to 29.80 inches by the end of the week. The mean reading for the week at sea level was 29.42 inches, being 0.31 inch

below that of the preceding week, and 0.58 inch below the average.

Temperature.—The highest temperatures of the air observed by day varied from 54° on the 20th to 47½° on the 15th; the mean value for the week was 51½°.

The lowest temperatures of the air observed by night varied from 38½° on the 17th to 46° on the 19th; the mean value for the week was 42°.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Feb. 15, 43°.2, + 4°.5; 16th, 46°.8, + 8°.1; 17th, 42°.5, + 3°.8; 18th, 46°.9, + 8°.1; 19th, 48°.7, + 9°.9; 20th, 49°.3, + 10°.4; 21st, 45°.8, + 6°.8.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 108° on the 21st, 103½° on the 20th, 102° on the 18th, and 100½° on the 17th; on the 19th the reading did not rise above 69½°.

Wind.—The direction of the wind was S.W., and its strength strong. The weather during the week was frequently fine, though wet and stormy.

Rain fell on every day of the week; the amount measured was 1.08 inch.

ENGLAND: Temperature.—During the week ending Saturday, February 21, the highest temperatures of the air observed by day were above 55° at Truro, Cambridge, Nottingham, and Sunderland, and below 53° at Brighton, Wolverhampton, and Bradford;

The mean value from all stations was 54°. The lowest temperatures of the air observed by night were below 34½° at Truro, Wolverhampton, Nottingham, Liverpool, Bradford, and Leeds, and above 40° at both Brighton and Norwich;

The mean of the seven high day temperatures was above 51½° at Truro, Plymouth, and Cambridge, and below 49° at Wolverhampton, Bradford, and Leeds;

The mean of the seven low night temperatures was below 40° at Wolverhampton, Nottingham, Hull, and Leeds, and above 42° at Plymouth, Brighton, Blackheath, Cambridge, and Norwich;

The mean daily range of temperature in the week was above 11° at Truro and Wolverhampton, and below 8° at Brighton and Norwich;

Rain.—Rain fell every day of the week at almost every station, and the amounts measured were large. The heaviest falls were at Bristol, 3.72 inches, Truro, 1.99 inch, and Sheffield, 1.64 inch;

SCOTLAND: Temperature.—During the week ending Saturday, February 21, the highest temperatures of the air observed by day varied from 52½° at Aberdeen to 49° at Greenock;

The mean temperature of the air for the week from all stations was 45°, being 9½° higher than the value for the corresponding week in 1879.

Rain.—The heaviest falls of rain were at Greenock, 1¼ inch, and at Aberdeen and Perth, 1¼ inch; and the least falls were at Edinburgh and Leith, both half an inch, and Glasgow three-quarter of an inch;

DUBLIN.—The highest temperature of the air was 54½°, the lowest 27½°, the extreme range 27°, the mean 44½°; and the fall of rain 1.14 inch.

JAMES GLAISHER, F.R.S.

Enquiries.

He that questioneth much shall learn much.—BACON. DOUBLE SWEET ALYSSUM.—What is "the original and true new Double Variegated Sweet Alyssum," the entire stock of which Messrs. Miller & Hunt, of Chicago, advertise as having been "purchased of a florist in Danville, Ills., a year since, has been thoroughly proved by us the past season; and we consider 'it far in advance of all others for bedding or bordering, from its perfect symmetry of form: a quality not possessed by other varieties'?" Does any reader know?

MENTHA PULEGIUM GIBRALTARICUM.—Will some of your correspondents kindly tell me the quickest and best way to get up a good stock of Mentha pulegium Gibraltaricum for this season's bedding? G. W. H.

SALVIA SPLENDENS, MRS. STEVENS.—Have any of our readers fallen in with this Salvia, which is considered in America as a great acquisition, the flowers being of a rich shade of crimson-maroon, entirely distinct from anything before seen in Salvia splendens, with which it is identical in habit and growth and size of flower-spike? Mr. Peter Henderson, of New York, speaks of it from personal possession.

TAMARIND SAUCE.—Can any of your readers give me a recipe for making Tamarind sauce? We used to have it with pork at Singapore. H. E. C.

VINES FOR FORCING IN POTS.—Will you kindly let me ask what the qualities of Duke of Buccleuch are as a Vine for pot forcing? Also, whether Early Ascot Frontignan is useful for that purpose, and what the size of the berries is? R. D. B.

Answers to Correspondents.

ADIES NOBILIS: W. H. G. The knots in question are the work of an insect unfortunately too common. If you wish to save your other trees, we should advise you to cut the affected one down and burn it.

ANTHURUM SCHERZERIANUM: J. Barrett. A good average in size, but by no means so fine as Mr. Ward's variety, or indeed as many others that we have seen.

BEGONIA: R. J. H. When you send a leaf and flower we will give you our opinion of its merits.

BOOKS: E. H. Scpell. Greenhouse Management for Amateurs (Bazaar Office, 170, Strand, W.C.).

CELERY: Enquirer. Leicester Red and Manchester Red, Wright's Grove White and Veitch's Solid White.

CLASSIFICATION OF EXHIBITORS: R. Tyson. As used in reference to country shows, the designation "amateurs" is understood to apply to persons who manage their gardens themselves, or with more or less assistance from a jobbing gardener or garden labourer, and who do not systematically derive pecuniary advantage from the pursuit. Gardeners, properly so called, are either nursery gardeners, market gardeners, or gentlemen's gardeners, the latter being employed by private individuals to undertake the management of their gardens for them. Cottagers are understood to be cottage residents earning their income by daily labour other than gardening, and who manage the gardens attached to their cottages, or one of the allotment plots rented by them, by themselves or with the aid of any of the members of their own family. No rule or definition can be expected to be of absolutely universal application; but these exceptional cases should be dealt with equitably on their own merits by the managing committee, at the time.

GARDENERS' ROYAL BENEVOLENT INSTITUTION: H. S. James. Write to Mr. E. R. Cutler, 14, Tavistock Row, Covent Garden, W.C.

HOT WATER: J. Paterson. Perkins' system of heating is now very little used; you had better consult one of the many leading hot-water engineers, whose names appear from week to week in our columns.

MASDEVALLIAS: H. E. C. The abortive breaks on your Masdevallias were very likely caused by your plants having received a severe check at the roots. Have they been lately broken to pieces with a view to propagation? Few persons can boast of possessing plants of the Bull's Blood variety. I feel certain, with better root-action, they will right themselves. J. C. Spyers.

MELONS: H. B. Do not stop the shoots till the fruit has set.

MEN FOR A 20-ACRE GARDEN: H. C. It is impossible to give a useful reply to such an indefinite question.

NAMES OF PLANTS: J. McP. Your Masdevallia is not M. Harryana sanguinea, but M. Veitchiana, a better thing.—H. J. Ross. 1, Asplenium fontanum; 2, Cystopteris alpina; 3, the Australian Asplenium bulbiferum; 4, Dendrobium primulinum.—F. Corriu. 1, smashed beyond identification; 2, Epidendrum ciliare var.—T. C. C. 1, is a Cœlogyne, but the material of both numbers sent is quite insufficient for naming.—H. J. Annon. 1, Dendrobium Lindleyanum; 2, Coccoleba platyclada; 3, Berberis Wallichiana; 4, Abies Douglasii; 5, Maxillaria—material insufficient; 6, Rhododendron dahuricum.—P. B. C. 1, Odontoglossum pulchellum; 2, Bletia hyacinthina.—G. H. M. Dendrobium secundum and Equisetum arvense.—J. W. H. 1, Odontoglossum pulchellum; 2, Dendrobium Lindley-

anum; 3, Bletia verucunda; 4, Cypripedium insignis, a fine variety; 5, Calanthe vestita; 6, Cheilanthes hirta.—W. J. T. Odontoglossum Rossii.—H. C. 1, Mesipiteris tannensis; 2, Viscum Lindsayi; 3, Bauera rubrioides; 4, Grevillea punicea; 5, Mirtella reticulata; 6, seems to be the male of Casuarina Fraseriana, a rare species, but requires cones to make certain. Xerotes belongs to the natural order Xerodictica.—G. Wall. 1, Lopezia racemosa; 2, Salvia gesneriflora; 3, Habrothamnus fasciculatus.—J. W. C. 1, Camellia, something like Chaudleri, but we do not undertake to name florists' flowers; 2, Blechnum latifolium; 3, Adiantum pubescens; 4, A. trapeziforme, var. pentadactylon; 5, A. colpodis; 6, A. concinnum latum.—C. W. D. The "Paris Daisy," or Marguerite, is Chrysanthemum frutescens, and your plant is the yellow variety known as C. frutescens Etoile d'Or. See our last number, p. 241.—E. H. Scpell. Arabis lucida variegata.

NYMPHILEA ALBA, VAR. ROSEA: E. T. R. 1. It must be here, since it comes from the North European lakes. 2. It was grown and flowered at Kew in the summer of 1878. Messrs. Froebel, of Zurich, catalogue it under the name of N. alba Caspary, needlessly given to it in France. We also find it in Mr. Parker's catalogue, under its proper name, but probably it is scarce. 3. In neither of the cases named is it priced, so that probably it is dear. 4. It would grow in any place which would be suitable for the common Water Lily, and therefore ought to grow in the sunken barrel which receives the drainage of your lawn.

ONCIDIUM GARDNERI: H. E. C. O. Gardneri (not Gardnerianum, as written in error) is described by Lindley in Hooker's London Journal of Botany, vol. ii., p. 662.

SALMON DISEASE: E. W. P., Fulham. The only full account of the fungus Saprolegnia ferax that we know of in English is the illustrated description of the "Salmon Disease," written for this paper by Mr. Worthington Smith, and published in our columns for May 4, 1878.

SCILLA MARITIMA: T. S. S. This is the medical Squill, a native of the South of Europe, the modern name of which is Urginea maritima. It will be better in the cool-house than in heat. The leaves should be allowed to grow on, well exposed to light, till they reach their full maturity; and then, after the bulb has rested, it will, if strong enough to flower, throw up an erect spike of greenish-white flowers, before the leaves grow afresh.

VINES: John Polson. The Vine roots you have sent us appear to be dead. We can gather nothing from the samples of soil without making an analysis. The recovery of the Vines is extremely doubtful, but you will be able to settle that point as soon as they should commence growing.—A. B. C. The cause of your Vines breaking so badly is no doubt owing to the imperfect ripening of the buds or wood last autumn.

VINES DYING: E. H. Your Vines are dead; if that there is no doubt. Were the stems, or any part, exposed to the frost in the early part of December? We think it most probable frost is the cause of the mischief. Some of the roots are alive. Your case is not exceptional.

Markets.

COVENT GARDEN, February 26.

We have scarcely any alteration to note this week, the only feature being the easier state of the vegetable market. Good plump samples of late Grapes are now realising high prices, the supply reaching us from extreme sources only. Business quieter. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—WHOLESALE PRICES.

Potatos:—Regents, 100s. to 140s.; Flukes, 120s. to 160s.; and Champions, 150s. to 190s. per ton. German produce is making from 6s. to 7s. 6d. per bag. New English Potatos are realising 2s. per lb.

SEEDS.

LONDON: Feb. 25.—The market to-day was poorly attended, and the business doing very small. As regards American red values continue to decline; in fact the prices now current are those which in ordinary years usually obtain at the close of the sowing season, when speculative purchases are made for holding over. French seed can also be bought on greatly reduced terms. In Trefoil a moderate business has been passing at somewhat easier rates. Fine clean white is not over-abundant. Very low quotations now prevail for Alsike. No change in grasses. Spring Tares meet a steady demand at previous currencies. Bird seeds are without quotable variation. Owing to the recent drop of 30 per cent., split Lentils are now exceedingly cheap. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CATTLE.

At Copenhagen Fields on Monday there was a considerable advance in the price of finest descriptions of beasts, and all kinds were rather dearer. The favourable weather and shortness of stock in hand caused a brisk demand. For sheep the demand showed an increase on last week. Choicest kinds were readily disposed of at advanced rates, and inferior qualities were difficult of sale. Good calves were in demand. Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 8d. to 6s. 2d.; calves, 5s. to 6s. 8d.; sheep, 5s. to 5s. 6d., and 6s. 6d. to 6s. 10d.—Thursday's trade showed no fresh feature. The condition of the beasts was not so good as on Monday, hence the top price was weaker, but a fair trade was done. Sheep sold quietly at late rates. Calves and pigs were unaltered in price.

HAY.

Tuesday's Whitechapel Market report states that there was not much demand for fodder, and prices were as follows:—Prime Clover, 100s. to 125s.; inferior, 80s. to 95s.; prime meadow hay, 80s. to 95s.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—At Thursday's market a short supply of hay and straw was on offer. The trade was rather better, and prices were firm.—Cumberland Market quotations:—Superior meadow hay, 95s. to 105s.; inferior, 40s. to 72s.; superior Clover, 115s. to 128s.; inferior, 84s. to 95s.; and straw, 34s. to 40s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies are only moderate, and the trade steady without animation. Scotch Regents, 140s. to 160s.; do. Champions, 150s. to 170s.; Lincolnshire do., 150s. to 173s.; Victorias, 160s. to 180s. per ton. German reds, 6s. 6d. to 8s.; Belgian kidneys, 6s. 6d.; French whites, 6s. per bag.—During last week 52,055 bags of Potatos were received at London from Hamburg, 9902 from Rotterdam, 5273 bags 116 barrels from Harlingen, 637 bags 571 casks from Malta, 1154 bags from Amsterdam, and 752 bags from Antwerp.

Government Stock.—On Monday Consols closed at 98 1/4 to 98 1/2, for delivery, and 98 1/16 to 98 1/8 for the account. The same figures were recorded at the close of business on Tuesday and Wednesday. Thursday's final quotations were, for delivery, 98 1/8 to 98 1/4, and for the account, 98 1/2 to 98 1/2.

CARTERS' DISEASE-RESISTING POTATOS FOR PLANTING.

IMPORTANT CAUTION

This variety was selected from the old MAGNUM BONUM purchased in 1877 by Messrs. CARTER direct from the raiser, Mr. CLARKE. Messrs. CARTER find it necessary to issue this caution, as it has come to their knowledge that Potatos have been sold as CARTERS' IMPROVED MAGNUM BONUM, but which were a spurious and very inferior kind. Early Orders recommended.

Price, per Sack, 33s.; per Bushel, 12s. Much cheaper per Ton and Half Ton.

CARTERS' SELECT STOCK.

Awarded a First-class Certificate by the Royal Horticultural Society,

with the following remarks:—"The Committee were of opinion that the 'Scotch Champion' Potato was remarkable for resisting the disease, and is a Potato of good quality."

Price, per Sack, 28s.; per Bushel, 10s. 6d. Much cheaper per Ton and Half Ton.

Descriptive LISTS Gratis and Post-free.

THE QUEEN'S SEEDSMEN, HIGH HOLBORN, LONDON, W.C.

GERANIUM CUTTINGS, at 8s. per 100, for cash, including Vesuvius, Lady Constance Grosvenor, and Old Tom Thumb.—J. WILLIS, Nash Court, Tenbury.

From CAPTAIN JAS DE COURCEY HUGHES, *Rathdowny, Queen's County, October 24.*

"I enclose Post-office Order to amount of account, and am much pleased with the rooted cuttings I got from you. They all turned out well, and made particularly nice shaped plants."

From ROBERT BOULT, Esq., *Halvergate, July 5.*  
 "I have the pleasure of informing you that the collection of Pelargoniums sent by you to Holland last Autumn, to Mr. V. W. de Villeneuve, was awarded the Gold Medal at the Horticultural Show held this week at Nymegen, Holland."

Cheques or Post-office Orders to

TOWN CLOSE NURSERIES, NORWICH.

"Bank Chambers, Norwich, October 24, 1879."  
"T. W. Helliwell, Esq., Brighouse—Sir,—I went yesterday and examined the Glass Roof Glazed by you, under my directions, at Sandringham, for His Royal Highness the Prince of Wales, and found it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can.—Believe me, yours faithfully,  
"C. SMEDLEY BECK, Architect."  
**T. W. HELLIWELL, Brighouse, Yorkshire, and 19, Parliament Street, LONDON, W.C.**

Price List on application free.

# TUBULARS v. SADDLES.

Replying to MESSRS. WEEKS, I beg to inform them that my suggestion is perfectly bona-fide, and that I have no props to lean upon.

I am the Proprietor of a Boiler, Saddle-form, and fittings for the same, that I consider the best in England! MESSRS. WEEKS doubtless think the same, hence their challenge.

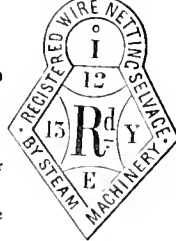

I do not make the Boiler, but I presume MESSRS. WEEKS do not cast theirs; they fit them up no doubt, so do I mine.

I shall be pleased to receive a reply to the question in my last advertisement.

JOSEPH BRAMHAM,  
Hot-water Engineer,  
104, Dale Street,  
Liverpool.

**KINAHAN'S LL WHISKY.**  
 Gold Medal, Paris Exhibition, 1878; Dublin Exhibition 1865, the Gold Medal.—20, Great Fitchfield Street, London, W.

**EPPS'S COCOA.**  
**GRATEFUL AND COMFORTING.**  
 "By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*

JAMES EPPS AND CO., HOMOEOPATHIC CHEMISTS.

**The most astonishing Cures of Coughs, Bronchitis, Throat and Chest Diseases (this week) by DR. LOCOCK'S PULMONIC WAFERS.**  
 —Mr. SWAIN, M.P.S., 249, Mill Street, Liverpool, writes—"I can highly recommend Dr. Locock's Pulmonic Wafers for all Throat Irritation and Chest Diseases." They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Coughs, Colds, and taste pleasantly. Sold at 1s. 1/2d. and 2s. 9d. per box.

**DINNEFORD'S MAGNESIA.**  
 The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
 and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
**HOLLOWAY'S PILLS and OINTMENT**  
 —It is impossible to over-estimate the benefits these effective remedies have conferred on mankind, and so great has been their success in every part of the world that their names have become "familiar in our mouths as household words," as ready remedies for Constipation, Indigestion, and every kind of blood impurity. The action of these Pills is essentially that of purifiers of the blood, hence they strike at the root of nearly all the diseases to which our flesh is heir, neutralise the ill effect of malaria and unhealthy atmosphere, and check the onset of Fevers, Inflammations, and Catarrhs. The Ointment acts as a detergent and cleansing agent, reduces Glandular Swellings, and quickly heals Chronic Ulcerations.

W. G. SMITH & CO.,  VICTORIA WORKS,  
BURY ST. EDMUNDS,  
SOLE MANUFACTURERS OF  
BEARD'S PATENT METALLIC NON-CONDUCTING GLASSHOUSES.

Iron Houses possess many valuable advantages over Wood. They are much more Durable, Lighter and Stronger. The Glass is screwed in between two layers of Elastic Material, whereby a perfect joint is secured without risk of breakage.

The above have all received First-class Certificates of Merit from the Floral Committee of the Royal Horticultural Society.

The whole of the Stock of them has passed into our hands, and we hope to distribute them in May next.

The price will be 7s. 6d. per Plant, or the set of Five for 35s.

The following are Extracts from Letters received by Mr. R. GILBERT from some of the leading Practical Horticulturists, and from the Horticultural Press.

From Mr. A. F. BARRON, Superintendent of the Royal Horticultural Society's Gardens, Kensington:—

"I received the Primula blooms, and I can only say they were splendid. They were far finer than anything I have ever seen in the Primula way."

From Mr. HENRY CANNELL, Swanley, Kent, an acknowledged authority on all Floral matters:—

"Dear GILBERT,—I well examined your Primulas when shown at Kensington, and was much impressed with their beauty. The splendid flowers now before me confirm my previous opinion."

From Mr. WILLIAM CARMICHAEL, (late Gardener to His Royal Highness the Prince of Wales) Crew Hall Gardens, Bath, March 7, 1877:—

"Dear GILBERT,—Your Double Primula blooms to hand. They are certainly the best by far I ever saw. Their compact shape and diversified colours are most attractive, coupled with such a beautiful fringed edge. I congratulate you on such a success."

From Mr. EDWARD LUCKHURST, Oldlands, Uckfield, Kent:—

"The blooms of Double Primulas which you have sent me are quite magnificent, and infinitely superior to any I have ever seen. They have the fulness, freshness, brightness, and size, which all other Double Primulas I have seen lacked."

From Mr. JOHN WILSON, Gardener to his Grace the Duke of Norfolk, K.G., Arundel Castle, Sussex:—

"SIR,—Your Primula flowers are to hand. The great variety of colour, coupled with their immense size, renders them objects of great attraction. Personally, I have never seen any to approach them. When better known they will doubtless be much sought after."

We have also received the following Letters:—

"To Messrs. OSBORN & SONS. Dear Sirs,—I have formed a very favourable opinion of Gilbert's Primulas, and consider them most valuable as decorative plants, and also very useful for bouquets and general cut flower decoration.—Believe me very faithfully yours, JOHN WILLS."

"Messrs. OSBORN & SONS, The Fulham Nurseries. Gentlemen,—I have found the blooms of Gilbert's Double Primulas you have from time to time sent me a great acquisition. As a florist's flower I do not know of anything more beautiful or useful, being far superior to any other varieties of Double Primula I have ever seen or used. For bouquet-making, and in fact every description of floral work, they will be found invaluable, being at once light and elegant. I have used them largely, and they have been greatly admired,—I am, Gentlemen, yours obediently, JAS. BROMWICH."

They have been exhibited at various seasons of the year, and have always been an object of great attraction and universal admiration, particularly so at South Kensington, and at the Ealing Show last November.

SALES BY AUCTION.

Valuable East Indian Orchids. MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, March 8, at half-past 12 o'clock precisely, a very extensive importation of EAST INDIAN ORCHIDS, consisting of the finest lot of Vanda cerulea ever brought to Europe, and collected by Mr. W. B. Freeman in a new locality: the plants are full of growth, one mass having not less than twenty-four, and in most perfect health, with sound green leaves. The sale also contains a grand lot of the rare and beautiful DENDROBIUM FREEMANI, Rchb. f., many of them in bud and flower and mostly with flowering growths all in perfect health. Also an importation of AERIDES FELDINGI (Fox-brush), in splendid masses; ODONTOGLOSSUM VEXILLARIUM, VANDA TERES, MORMODES PARDINUM, various COELOGYNES, & other ORCHIDS.

May be viewed the morning of Sale and Catalogues had.

Orchids and Lilies. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, March 10, at half-past 12 o'clock precisely, a great variety of ESTABLISHED ORCHIDS, including duplicates from several well-known collectors, many of the plants being in flower; 300 fine bulbs of LILIUM AURATUM, just arrived from Japan in fine condition; 1500 LILIUM species; 1000 LILIUM KRAMERI, ORCHID BASKETS, 200 LILIUM HIGRINUM FLORE-PLENA, GLONINIAS, ELEGONIAS, 500 AMARYLLIS BELLADONNA, 500 AMERICAN TUBEROSES, &c.

May be viewed the morning of Sale, and Catalogues had.

Valuable Imported Orchids. MR. J. C. STEVENS has been instructed by Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, March 11, at half-past 12 o'clock precisely, a grand importation of CYMBIDIUM EBURNEUM, in masses of unusual size and health; COELOGYNE ASSAMICA, Rchb. f., a free flowering new species, yellow and white, centre beautifully spotted purple; the new DENDROBIUM RUCKERI, Lindl., just brought home by Mr. W. B. Freeman; a fine lot of the splendid ODONTOGLOSSUM LUTEOPURPUREUM SPECTRUM, Rchb. f.; ODONTOGLOSSUM VEXILLARIUM, also BARKERIA CYCLOTELLA, Rchb. f. Flowers and drawings will be shown on the day of Sale.

On view morning of Sale, and Catalogues had.

Hardy Trees and Shrubs. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on SATURDAY, March 13, at half-past 12 o'clock precisely, a first-class collection of HARDY TREES and SHRUBS, from one of the most renowned Surrey Nurseries; 1000 Standard, Dwarf and Climbing Roses; Fruit Trees, Herbaceous Plants, Gladioli, Lilliums, Spiraeas, &c.

May be viewed the morning of Sale, and Catalogues had.

Odontoglossum Alexandræ, &c. MR. J. C. STEVENS has received instructions from the New Plant and Bulb Company, Colchester, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, March 15, at half-past 12 o'clock precisely, a large importation of ODONTOGLOSSUM ALEXANDRÆ, collected in the BEST LOCALITY in the neighbourhood of Bogota. The specimens offered are extremely large, from fifteen to twenty-five bulbs each, and commencing to break freely; the bulbs are also individually very large. ALSO CATTLEYA MENDELII, ODONTOGLOSSUM PESCATOREI, O. BLANDUM, O. TRIUMPHANS, &c.

Further particulars next week.

Important Collection of Orchids. MR. J. C. STEVENS has received instructions from Captain Edwards to offer for SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, THURSDAY, and FRIDAY, March 17, 18, and 19, at half-past 12 o'clock precisely each day, the entire COLLECTION of ESTABLISHED ORCHIDS formed by the late Mr. Serjeant Cox, at Moat Mount, Mill Hill, near Hendon, and comprising good plants of nearly all the known varieties.

On view the mornings of Sale and Catalogues had.

Important Sale of about 600 fine Standard and other ROSES, selected FRUIT TREES, hardy CONIFERÆ, EVERGREEN and DECIDUOUS SHRUBS, AMERICAN PLANTS, some fine double CAMELLIAS and AZALEA INDICA, beautifully set with bloom-buds; ERICAS, EPACRIS, and other Greenhouse Plants; fine bulbs of LILIUM AURATUM and others, GLADIOLUS, DAHLIAS in dry roots, &c.

New Catalogue for 1880.

WM. CLIBRAN AND SON, The Oldfield Nurseries, Altrincham, Cheshire, will have great pleasure in sending their DESCRIPTIVE PRICED LIST upon application.

- Our Selection. Per doz.—s. d. Achimenes, in variety .. 3 0 Ageratum, small plants, per 100, 5s. .. 1 0 Ageratum, in pots, per 100, 15s. .. 2 6

THE BEST PLANTING SEASON.

THE LAWSON SEED AND NURSERY COMPANY (Limited) respectfully invite attention to their Extensive Stocks of FOREST, ORNAMENTAL, and FRUIT TREES, Dwarf and Standard ROSES, Vines, &c., all in splendid condition.

Special Railway Tickets to and from the New Nurseries, Granton Road, may be had gratis, at 1, George IV. Bridge, Edinburgh.

LEICESTER RED CELERY has again proved itself to be the hardiest, sweetest, most solid, and best Celery this unfavourable season; when most kinds have been soft and watery this has been good in every way.

HARRISON'S "LEICESTER SEEDS," of the choicest quality, are supplied in collections of 21s. and upwards, sent carriage free.

MAGNUM BONUM POTATOS.—A splendid sample of the above, grown from Seed, direct from the raiser (Mr. Clarke), price 7s. 6d. per bushel of 56 lb.

TREES FOR AVENUE, PARK, OR STREET PLANTING. ACER DASYCARPUM, 14 to 16 feet, girding 5 to 7 inches.

MAPLES, Norway, 12 to 16 feet. BECH, Purple, 10 to 12 feet. OAKS, Scarlet, 10 to 12 feet. CHESTNUTS, Spanish, 10 to 12 feet. SYCAMORE, 12 to 15 feet.

To the Trade. MAGNUM BONUM POTATOS. H. and F. SHARPE can supply the Trade with a very true stock of the above-named POTATO, grown from carefully selected tubers.

New Crimson-Scarlet Fringed Primula Seed. F. AND A. SMITH can supply the above (the same colour as exhibited by the Royal Horticultural Society, at South Kensington), in 2s. 6d. and 5s. packets.

GERANIUMS.—Stock Plants of New and valuable Geraniums with cuttings, for cash. The magnificent new Silver-edged Geraniums, with grand flowers of all colours, strong plants 4s. 6d. per dozen, 25s. per 100, packed and put on rail.

Vines—Vines—Vines. J. COWAN, The Vineyard and Nurseries, Garston, near Liverpool, is now offering a large and splendid stock of strong, short-jointed, and thoroughly ripened GRAPE VINES, suitable for fruiting in pots and planting Vineries.

SEED POTATOS.—Snowflake, Early Rose, Myatt's Prolific, Fortyfold, Bree's Prolific, Early Shaw, Paterson's Victoria, Regent, Dalmahoy, Fluke, Champion (Scotch), Redskin Flourball.

TREE SEEDS.—ABIES DOUGLASHI, post-free, 2s. 6d. per ounce. MENZIESII, post-free, 4s. per ounce. PICEA NOBILIS, post-free, 4s. per ounce. PINUS MONTICOLA, post-free, 3s. per ounce. LARCH, Native, 2s. per pound.

FERNS.—BEST TIME TO PLANT.—Instruction Book for Making Rockery, Planting, Growing, and Watering Ferns, with each order over 5s. Forty, twenty-five varieties, true Maidenhair, marium, Ceterach, lanceolatum, Limestone, sweet-scented Hay, scented Marsh, Parsley, spinulosa, Beech, Cystopteris, Hymenophyllums, others good, post-free, 3s.; 100 large Ferns, 7s.

The Best Cauliflower. SUTTON'S KING OF THE CAULIFLOWERS. Dwarf, compact, very large, firm, beautifully white heads. From Mr. JOHN CLARKE, Gr. to the Most Noble the Marquis of Ripon:—"Your King is a very dwarf, good strain of Cauliflowers, producing firm and beautifully white heads."

B. S. WILLIAMS having recently received from his Collectors and Correspondents in different parts of the world large consignments of ORCHIDS, and through having purchased several Collections in this country, is now in a position to offer good young healthy Plants at more reasonable prices than it has been possible hitherto to sell at.

Special Offer to Farmers, Gardeners, and Others. GEE'S SUPERIOR BEDFORDSHIRE GROWN SEED POTATOS, CABBAGE, and SAVOY PLANTS, &c. F. GEE has fine stocks of the above, which have been grown carefully on new land, fine samples, free from disease, and such that he can highly recommend to all who require a change of seed.

Table with 5 columns: Name of plant, Per bush of 14 lb., Per bush of 56 lb., Per Cwt. of 112 lb., Per Ton. Rows include EARLY ASHLEAF KIDNEY, SNOWFLAKES, EARLY ROSE and CLIMAX, LAIE ROSE and PEERLESS, NEW BEAUTY OF HEBRON, NEW BUBBANK SEEDLING and THE WASHINGTON, NEW MAGNUM BONUM, NEW SCOTCH CHAMPION, PORTER'S EXCELSIOR.

Good Peck Bags charged 3d. each, Bushels 6d., and Common Sacks, to hold 1 1/2 Cwt., 8d. each. ASPARAGUS PLANTS, splendid stuff, Battersea and Conover's Colossal, 1s. 6d., 2s. 6d., 3s. 6d., and 5s. per 100. RHUBARB, splendid for Planting, Victoria, Early Scarlet, and Prince Albert, 2s. 4s. per dozen; 10s. to 20s. per 100.

Special List of Cheap Ferns. THE ABOVE SPECIAL LIST of a large number of varieties of FERNS and SELAGINELLAS, offered at very low prices, will be forwarded on application.

SAMUEL AND JAMES SMITH, Tansley Nurseries, near Matlock, Derbyshire, have to offer the following, at per 1000:—ALDER, 2 to 3 feet, 20s.; 3 to 4 feet, 25s. ASH, Mountain, 3 to 4 feet, 18s.; 4 to 5 feet, 25s.

Vines—Vines—Vines. F. AND A. SMITH can supply the above, in strong close-jointed Canes, true to name, Fruiting 20. Price on application. The Nurseries, West Dulwich, S.E.

BENJAMIN REID AND CO., NURSERYMEN, Aberdeen, N.B., beg to offer at reduced rates the following extra stocks of transplanted TREES and SHRUBS, all clean and well rooted.

Grand New Coleus. J. PEED AND SONS beg to call special attention to the undermentioned NEW COLEUS, which obtained two First-class Certificates from the Royal Horticultural Society in June and July last.

To the Trade.

"PRIDE OF ONTARIO" POTATO.

H. AND F. SHARPE are now offering the above excellent POTATO, grown from their original stock. It gave universal satisfaction last season, having produced a fine yield, and comparatively free from disease. As the stock this season is limited early orders are requested. Seed Growing Establishment, Wisbech.

New Cucumber. Sir Garnet Wolseley.

JOSEPH HAMILTON AND SON, Wellington Place, near Carlisle, will supply SEEDS of the above, in Packets of 6 Seeds, post-free for 30 stamps. "The points in which Cucumber Sir Garnet Wolseley surpasses all other long-fruited varieties are the symmetry of its fruit, and the abundance with which they are produced; there being no shank or handle to Sir Garnet."—Gardeners' Chronicle, September 27, 1877.

WILLIAM BARRON AND SON'S Descriptive CATALOGUE of Coniferæ, Hardy Ornamental Trees, and General Nursery Stock—also their Rose, Forest, and Fruit Tree CATALOGUE—may now be had on application. A personal inspection of their unrivalled stock solicited. The Nurseries are three minutes' walk from the Borrowwash station on the Midland (Derby and Nottingham) Railway. Elvaston Nurseries, Borrowwash, Derby.

Illustrated Hardy Perennials.

THE present year's issue of this CATALOGUE is now ready, and contains a fine selection of New, Rare and Hardy Perennials, also collections of Orchids and Carnivorous Plants; Bulbs, including Anemones and Ranunculus; Hardy Ferns, Aquatics, Bamboos, and Ornamental Grasses, &c. Also an abbreviated List of Hardy Florists' Flowers, consisting of such only as should be planted at this early season. Post-free on application.

THOMAS S. WARE, Hale Farm Nurseries, Tottenham, London.

Important Notice.

To NURSERYMEN, BUILDERS, and OTHERS.

MESSRS. R. AND G. NEAL having to clear a large portion of their Grounds (15 Acres), the Land being required for Building Purposes, at once beg to offer the whole of the stock at a very low price, to effect a clearance. The stock consists of hundreds of thousands of FOREST and ORNAMENTAL TREES, such as Limes, Planes, Poplars of all kinds, Elms, Willows, Almonds, Laburnums, &c.; also thousands of large FRUIT TREES, SHRUBS, CLIMBING PLANTS, &c., and millions of SMALL PLANTS suitable for Nurserymen. Special LISTS on application to Messrs. R. AND G. NEAL, Nurserymeo, Wandsworth Common, S.W.

NEW SCARLET AND PURPLE PRIMULAS.

WHY grow the old ordinary kinds when you can have the colours nearly as bright as the Zoota Pelargoniums?

Per pkt. s. d. These are totally away from all others, and even superior to the Chiswick Red and rubro-violeacea which were awarded First-class Certificates last November.

SWANLEY RED..... 5 0  
SWANLEY PURPLE.. 5 0  
SWANLEY CRIMSON 2 6

My Primula-house can now be seen. The finest collection ever brought together. The Editor of the Gardeners' Magazine says the crowning glory of the group is the great Single Red, the colour deep and rich, with a fine fiery glow.

SEND FOR A CATALOGUE.

The "Christian Union" says:—"MR. CANNELL'S HOME FOR FLOWERS at Swanley, Kent, is known to all florists for its varied excellencies, but it is well that it should be known to multitudes who may not be professional florists, but who have a really good and natural liking for a pretty flower or plant in their private gardens, verandahs, or window sills. Everything in the enjoyment to be obtained from this period onward through the season depends on the stock from which the seeds or plants are derived. Mr. Cannell's establishment at Swanley is devoted exclusively to Florists' flowers, and is probably the only one in the kingdom of which this can be said; and as Mr. Cannell himself is a Fellow of the Royal Horticultural Society, every one may judge what results ensue from a highly specialised direction of this kind under the most ample science and experience. In looking over the Descriptive Catalogue of Seeds one perceives the immense variety of genera and species therein embraced; but the testimonials appended are still more convincing and carry a more palpable weight of evidence to the general mind. The testimonials come not only from every quarter of the United Kingdom, but from India, Australia, and others parts of the world to which English culture in other forms has so widely and permanently spread. His Seeds are of the highest excellence. It is one of the greatest of all the wonders in the floral culture of this country."

SEED CATALOGUE POST-FREE.

THE above is now admitted throughout the world to be the most replete Illustrated and Descriptive CATALOGUE of Florists' Flowers and the Seeds ever issued. No garden of the least pretence should be without this work; even the professional refers to it for guidance, as it describes all the best varieties (new and old) in cultivation, supplied either as cuttings, root cuttings, or plants, at the lowest price consistent with correctness.

CALCEOLARIAS (Spotted).—H. C.'s best Strain in 60's, 2s. 6d., by post; 2s. per dozen. Special price per 100 and 1000.

THOMAS METHVEN & SONS

ARE NOW SENDING OUT THE VERY DESIRABLE

NEW APPLE, "NORTHERN DUMPLING."

This large Culinary Apple, for which a Cultural Certificate was awarded by the Royal Horticultural Society of London in 1874, was raised from seed some years ago by Mr. J. Webster, Gordon Castle Gardens, as far north in latitude as 57° 38'. It is a cross between "White Moor" and "Stirling Castle," being much larger than either sort, and of a very different form; stalk, much sunk, short and fleshy; eye, hollow

and slightly ribbed round the apex; shape, roundish oblong; colour, yellowish-green, with a rosy tint next the sun.

The "Northern Dumpling" has proved to be both hardy and prolific—much desired qualities in a British climate—combining the excellencies of the well-known old favourites with a constitution admirably adapting it for cultivation in cold and exposed districts.

A Coloured Lithograph of the Apple will be sent to every Purchaser of Six Trees.

Price, 7s. 6d. each. The usual Discount to the Trade.

NEW AMERICAN POTATOS.

The following varieties have been carefully tested in various parts of this country as well as in Europe, and have met with the unqualified approval of all who have given them a trial. For exhibition purposes they are unrivalled, and have already secured many prizes:—

1. PRIDE OF AMERICA.—In appearance resembles the Snowflake, a few days later; very productive, large size, an excellent keeper; of superior quality.

2. MATCHLESS.—Tubers very handsome, round, pale red; flesh fine grained, pure white, and of excellent quality. A great cropper, an excellent keeper.

3. SILVERSKIN.—A cross between the Early Rose and White Peach Blow. Tubers medium to large. Skin smooth, silvery white, russeted. Flesh snowy white, fine grain, splendid quality; an excellent keeper.

One pound of either of the above varieties will be mailed post-paid to any address in Europe, upon receipt of 4s., or its equivalent in English currency.

Remittances can be made in Post-office Stamps or Postal Money Order on New York or London, payable to B. K. BLISS and SON.

The above varieties can also be obtained of Messrs. HOOPER and CO., Covent Garden, W.C.; of CARTER, DUNNETT, and BEALE, London, W.C.; of D. BRINKWORTH and SONS, Reading; of KERR and FOTHERINGHAM, Dumfries, Scotland.

BLISS' ILLUSTRATED POTATO CATALOGUE contains a descriptive list of all the new varieties recently introduced, with many other desirable sorts, beautifully illustrated. Centennial Collection of 500 varieties. Also much useful information upon the cultivation of this valuable esculent. Mailed post-paid to applicants enclosing six penny stamps.

All of the older standard varieties, sound and healthy stock, supplied in any quantity at market prices.

PARIS MARKET: NEW GARDEN

TURNIP.—A fine new Continental variety, of rapid growth and delicious flavour. Quite distinct from all other Turnips. It is exceedingly sweet and juicy, and should be found in every Garden. Per oz. 1s., post-free.—DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

DANIELS' DEFIANCE CABBAGE.—The finest variety in cultivation, grows rapidly to a large size, and of the most delicious marrow flavour. Has been awarded First Prizes wherever exhibited. Per packet 1s. 6d.; per oz. 3s. 6d., post-free.—DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

DUKE OF EDINBURGH CUCUMBER (Daniels').—Beautiful white-spined variety, pronounced by all competent judges to be the finest Cucumber in cultivation. Fine robust constitution and habit, fruit growing rapidly to the length of 30 to 36 inches, being at the same time of the most beautiful proportions, and of a fine rich green colour, which it retains to the last. First-class for Exhibition. Per packet, 1s. 6d. and 2s. 6d. post-free. Beautifully Illustrated CATALOGUE free to all customers on application.—DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

Further particulars next week.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

# BEAUTIFULLY-GROWN SPECIMEN ORCHIDS

## MR. JAMES ANDERSON,

### NURSERYMAN and VALUER, MEADOWBANK, UDDINGSTON, GLASGOW,

Has bought the entire Collection of Orchids of a Gentleman  
in Scotland who is giving up their Culture.

They comprise the cleanest and best finished lot of plants that have possibly ever been offered in one lot, among which might be named CATTLEYAS and LÆLIAS of sorts, VANDAS, AERIDES, SACCOLABIUMS, DENDROBIUMS, ODONTOGLOSSUMS, MASDEVALLIAS, ONCIDIUMS, CYPRIPEDIUMS, &c., full particulars of which are given in CATALOGUES, which will be sent to Applicants. Any particulars wished for will be given on application to Mr. Anderson; and Gentlemen or their Gardeners will have an opportunity of seeing the plants on the premises if desired. Mr. Anderson has arranged with the late Owner for the keeping of the plants up to August, if necessary.

Mr. Anderson need scarcely point out how advantageous it is for buyers to get established plants direct from the houses in which they have been growing—thus avoiding the checks and chills, and injured growths which invariably follow those consigned to Auction Rooms. The Collection offers a rare opportunity for buyers in general adding to their stock at cheap rates, no matter whether it be beginners or those who are seeking for the rarest and best things in commerce.

Meadowbank Nurseries, March, 1880.

## Notice!

Remarkable Success during the past  
Potato Disease Year.

## Notice!

# AMIES' ANTI-FUNGOID POTATO MANURE.

*It is acknowledged by many of the leading Potato Growers to be the most valuable Manure ever offered to the public for aiding the culture of this important esculent. During the past few years the finest crops of Potatoes have been produced with it. It is prepared with special attention to the needs of the Potato plant; at the same time it fertilises and acts directly on the soil. It gives health and vigour to the plant, and provides the particular foods required for its proper nourishment and development during the various stages of growth, producing large sound tubers of uniform size. It is an anti-fungoid, and affords exceptional protection against the various parasitic destroyers of vegetable life, and in numerous well-authenticated instances has been found to BE A GREAT PREVENTIVE OF THE POTATO DISEASE. From the foregoing it will be seen that this Manure is peculiarly suitable for the cultivation of the Potato, and a great desideratum to Potato Growers.*

The extraordinary success that has attended the use of this Manure during the past season (1879), in which the Potato disease has been so prevalent, induces us to offer it to the public with the utmost confidence. A few of the numerous reports we have received, testifying to the value of the Manure, will be found in our new pamphlet, which may be had, post-free. The following report by the celebrated agricultural chemist, Mr. BERNARD DYER, F.C.S., A.I.C., and the extract from the *Mark Lane Express*, a leading agricultural journal, will be read with interest:—

#### Mr. BERNARD DYER'S REPORT.

"I have examined a sample of this Manure and find that it contains **Phosphate of Lime, Ammonia and Potash Salts, in suitable proportions**, and is compounded in addition with certain chemical ingredients of an antiseptic nature, which, if the Manure is used in accordance with the directions supplied, may be expected to check fungoid growth in soils, to discourage the existence of insects, and to favour the healthy development of sound tubers."

#### "MARK LANE EXPRESS," March 3, 1879.

"We have ourselves proved by direct experiment, very carefully conducted, the value of the Manure supplied for Potatoes. We do not believe in any Manure as a perfect preventive of Potato disease, though anything which promotes the health and strength of the plants enables them to some extent to resist the attacks of disease, and it may be that the chemical effects of the Manure are unfavourable to the free development of the fungus. As an insecticide our experiment rendered us disposed to decide in favour of the Manure. It is only fair to say, that there are few fertilisers with respect to which the verdict of those who have tried them is so generally favourable as in the case of the Manure in question."

#### PRICES (In Stamped and Sealed Bags):—

B. S. WILLIAMS PRIZE MEDAL FLOWER SEEDS.

- BEGONIA, New Bedding variety, finest mixed... 1 6
- BEGONIA, Splendid Mixed Hybrids. This splendid strain includes all the best and new named varieties, and has this season taken First-class Prizes at the Royal Horticultural and Royal Botanic Societies, and at most of the Provincial Shows... 1 6
- CALCEOLARIA, Williams' Superb Strain, 5s., 3s. 6d., 2s. 6d. and 1 6

From Mr. T. BEDFORD, Gardener to the Hon. Mrs. Barton, July 1, 1879. "You will be pleased to learn that the Calceolarias grown from your seeds were the best that my employer has ever seen."

- CINERARIA, Weatherill's Extra Choice Strain, 5s., 3s. 6d., 2s. 6d., and 1 6

From Mr. GRAY, Gardener to — Walker, Esq., January 8, 1880. "I am pleased to inform you that the Cineraria seed had from you last year has proved a grand strain, for I have some very fine flowers over 2 inches across."

- CYCLAMEN PERSICUM, Brilliant (New) .. 5s. and 3 6
- CYCLAMEN PERSICUM GIGANTEUM, 5s., 3s. 6d. & 2 6
- CYCLAMEN PERSICUM GIGANTEUM RUBRUM (New) .. .. . 5s. and 3 6
- CYCLAMEN PERSICUM, Williams' Superb Strain, 5s., 3s. 6d., 2s. 6d., and 1 6

All the above Cyclamen have received First-class Certificates from the Royal Horticultural and Royal Botanic Societies.

- PRIMULA SINENSIS FIMBRIATA COCCINEA (New) .. .. . 5s., 3s. 6d. and 2 6
- PRIMULA SINENSIS FIMBRIATA, Williams' Superb Strain, Red, White, or Mixed, 5s., 3s. 6d., 2s. 6d. & 1 6

The above Primulas have been awarded Silver Medals, and also First-class Certificates at the Royal Horticultural and Royal Botanic Societies.

Flower Seeds Post-free.

SATURDAY, MARCH 6, 1880.

ART IN THE CONSERVATORY.

YOUR readers must have felt indebted to Mr. Adams for his paper on Art in the Conservatory. It has given rise to considerable variety of opinion and some discussion. The subject is, however, by no means threshed out. Nowhere is Art more needed, nor less often found. Not that I believe in or desire what are called artistic conservatories: these have been mostly the toys or crotchets of architects, and the horror and despair of cultivators. At one time, and that not so very long ago, no one was considered qualified to plan or put up a glasshouse but an architect or great builder. The results were often highly ornate and expensive houses of the least possible use for cultural purposes. Attached conservatories, especially, destroyed rather than conserved plant life; they were made to harmonise and fit in with the mansion — no matter whether they suited the plants or not. As a rule, they were far too lofty and too dark for cultural purposes.

As the nature and requirements of plant-life became better understood, there was a sudden rebound from these pretentious dormitories or hospitals to mere glass sheds. Like most reactions, the rebound from excessive formality to severe simplicity went too far. Cultivators had learned by bitter experience to hate the name of art as applied to glasshouses; architects and all their horticultural works were alike shunned and condemned. Not only was a new race of horticultural builders called into existence, most of whom did good work for horticulture by building houses to suit the plants rather than to please the eye, but almost every successful grower became his own builder. The glass erections slipped from the hands of architects into those of gardeners. This was a decided gain to horticulture, but it is no disparagement to practical men to say that the change was not all gain or wholly for the better. Many good growers proved indifferent designers or builders, as the numbers of mere glass sheds up and down the country testify.

Horticultural architecture has now assumed such national importance as to require the assistance of the best taste and the highest talent the nation has to bestow upon it. It is no disparagement of the practical talent which is the very backbone of horticulture, to affirm that the assistance of architects may be needful to design and give plans for the construction of conservatories and other glasshouses. Such plans should, however, invariably be submitted to gardeners in regard to their internal and cultural arrangements. In a word, the architect may at times be required to find taste and to provide stability and safety—the gardener all else the plants need. No doubt gardeners often have found both, and some so-called gardeners' houses are among the most ornamental as well as the most useful to be found

up and down the country. Still we look upon it as one of the most promising signs of the times, that architects like Mr. Adams are turning their attention to the subject of Art in the Conservatory; for while we may be said to teach and represent the highest art in the plants grown in glasshouses, we are also solicitous that the buildings themselves should be artistic. Mr. Adams also seems to be fully alive to the importance of light, heat, and air to plant-life and healthy growth. There is little to be added to these essentials—only those of occasional shade and an abundant supply of soft water, which may generally be collected from the roofs themselves.

But it is most important to impress on all concerned the fact, that the most severe regard for utility is by no means incompatible with a proper amount of ornament. Not only are utility and beauty compatible; but the latter forms no small portion of the former, inasmuch as congruity, that is, fitness, is an essential element of beauty. For example, all water-jugs, vases, glasses, may be said to hold water equally well; but the more chastely they are designed, the more elegantly formed, or the more perfectly finished—in a word, the greater their beauty, the more pleasant are they to look upon and to use; and thus their utility is enhanced in the exact ratio in which their beauty is heightened. The same remark would hold good of dwelling-houses, household furniture, the formation and adornment of gardens, &c. In fact, there seems to be far more truth than appears on the surface in the statement that beauty is probably the most useful quality or thing in the world.

Be that, however, as it may, it is as possible as it is desirable to combine beauty with utility in our conservatories and other glasshouses. Those attached to, or forming portions of, mansions or dwelling-houses, should be expressions of Art in their external appearance as well as models of cultural convenience in their internal arrangements. The great majority of conservatories are too lofty. For cultural purposes few need exceed a height of from 6 feet to 15 feet. Of course houses for Camellias, Rhododendrons, Tree Ferns, Palms, &c., may need to be more than double or treble the maximum height here indicated; but for all-round conservatories—that is, houses in which to grow flowers, or preserve such plants as Pelargoniums, Fuchsias, Heaths, Azaleas—these heights will prove ample. For it is found in practice that not only must plants be exposed to the light, but many of them thrive best when their heads are pretty close to the glass. The cultural failures in so many architectural conservatories arose quite as much from their extreme height as from their opaqueness. The plants, instead of developing into fine specimens, seemed always engaged in a race for the glass roof, which attenuated them into semi-skeletons. By placing the roof as close to them as is compatible with practical attention to their wants, and a full display of their beauty, the plants thrive better and it costs less to keep them warm.

The latter is a very important point in practice, for whatever ratio of proportions of pipe to area of cooling surface is adopted it is certain that the less air there is to be heated the less pipe will be needed and the smaller the coal bill. We would rather not pronounce *ex cathedra* on the amount of pipe needful per cubic foot of air. The great practical point is to have sufficient pipe. Pipe is bought but once, coal annually, and hence in the end pipe is far cheaper than coal. As much or more heat may also be diffused through the atmosphere of glasshouses from a greater surface of pipe, moderately warmed, than from a smaller quantity of pipe at a higher temperature; besides, the risk of injury to boiler and pipes

rises with the temperature. As in running it is the speed that kills, so in heating it is the pressure that bursts boilers, tries joints, blows the water out of pipes, smelts furnace bars and doors, and not seldom ruins all; hence the wisdom of over rather than under piping conservatories and all glasshouses. In all calculations of pipe to area it is wise to take zero as a starting point, as zero is reached occasionally; and meanwhile and always the extra piping will ensure greater economy of fuel; hence conservatories should have at least 1 foot of 4-inch pipe to every 20 or 25 cubic feet of air; and plant stoves, early vineries, and forcing-houses 1 foot of pipe to every 15 or 20 cubic feet of air.

There is also much room for the exercise of skill and even art in the form and disposition of the pipes used. Cylindrical pipes are probably the cheapest and safest, but it seems doubtful if they are the most economical. Pipes, or rather trays, 2 inches deep, a foot wide and a yard long, have been thought to radiate more heat from an equal amount of fuel. Oval pipes have also been recommended in our pages.

The usual plan of sinking the pipes beneath the iron gratings is the most artificial that could be conceived. Most of the heat absorbed by the bottom and sides of such chambers is lost to the warming of the air of the house. There is also probably a good deal of loss alike of pipe and heat in the usual plan of carrying pipes all round the conservatories and other houses to be treated. Heat, the most volatile force in Nature, is led with iron reins to every possible point, as if it were motionless as lead when left to itself. It would seem almost as reasonable to mount one's hunter in a farm waggon, and proceed thus after the hounds.

By the concentration of heating surfaces with ornamental coils, radiating tables, boxes, stages, shelves, a reduction of area might be effected, and a more thorough circulation of air insured. The latter is of the utmost importance from a cultural point of view. It is not enough that the air should be warmed, it must also be moved. Heat is the great moving force, and yet most of our heating arrangements proceed on the principle of distributing an equal amount of heat to every part of the house. In so far as it is possible to accomplish this, the internal atmosphere is forced to remain still and stagnant. Probably the next great advance in horticultural heating will consist in arranging the heating surfaces at convenient points at considerable distances apart. The heated air will speedily distribute itself, and in its search after an equilibrium of temperature the whole atmosphere of the house will be kept in perpetual motion. By thus concentrating the heat at different and relatively distant points, and raising the whole heating power well out of the ground, readily available sources of bottom-heat may easily be provided for cultural and forcing purposes, and the whole of the heat be utilised and turned to better account.

A good deal more art as well as common sense might also be employed to good purpose in the ventilation and shading of conservatories, as well as in the storing and distribution of water for cultural purposes; the law of proportion is also too often grievously sinned against in their construction. Of these and their most inartistic internal arrangement we shall probably have something to say on a future occasion. *D. T. Fish.*

*SAXIFRAGA BURSERIANA.*—This lovely winter flowering alpine is now a very attractive object in the York Nurseries, as also on the rock-work at Chiswick. The flowers, which are produced in great profusion, are pure white, borne on slender dull scarlet stems, arising from a dense tuft of greyish silvery leaves. There is also a beautiful variety of it flowering most freely, *S. Burseriana* var. *major*. The plant is larger in all its parts, and the blossoms fully twice the size of those of the ordinary type. It will be a welcome addition to our winter flowering rock plants.

## New Garden Plants.

ODONTOGLOSSUM RAMOSISSIMUM, *Lindl.* ;  
var. XANTHINUM *et* VIRIDE.

We are rather at a loss in our knowledge as to whether the yellow and the green *Odontoglossum* of this name grow mixed with the original variety with white and lilac flowers. I believe they grow separated. We must hope to get good information from an intelligent traveller, like Mr. Lehmann, who is always desirous to help science.

I have at hand a branch of the xanthine variety, a nice thing with yellow flowers, wavy twisted sepals and petals, with mauve-purple streaks and spots. The callus of the lip is of an indifferent ochre colour; around and before it is an area of radiating mauve-purple rays. It was sent by Mr. Harry Veitch, who states that it flowered with Mr. Vanner, of Chislehurst. The green variety is not recommendable to amateurs. It is one of those plants which sell easily when out of flower. *H. G. Rehb. f.*

ODONTOGLOSSUM WILCKEANUM, *n. hybr.\**

This is one of the most lovely *Odontoglossa* one can imagine. It is just intermediate between *O. crispum* and *O. luteo-purpureum*, and in olden times it might have been regarded as evidence of the two species being one and the same. The plant is said to be identical with plants of *O. crispum*. The peduncle bore a raceme of five very well developed flowers—very many for a tiny plant; thus furnishing another illustration of the free-flowering habit of hybrids, as was remarked the other day by Sir Trevor Lawrence when speaking of *Cypripedium Sedeni*. The texture of the perigone is as it is generally in *O. crispum* (*Alexandrae*). Sepals and petals of lightest whitish-yellow, far lighter than in *Odontoglossum Coradinei*. Sepals triangular, very crisp. Petals oblong triangular, much broader, with some projecting angular laciniae. Both kinds of organ have elegant brown blotches, which are marginal in the petals, transverse in the sepals. The lip is that of *O. crispum*, without the cartilaginous toothed lateral thickened plates, with three to five small tendril-like processes each side, and two ragged keels, which are free at their ends, including an intermediate apiculus, orange at the base, elsewhere lightest yellow with some brown blotches. Column pale whitish-yellow, with a few brown spots.

This beauty came with a quantity of *O. crispum* (*Alexandrae*), first into Mr. S. Low's hands in 1878. Then it came into the possession of M. Massange, whose collection of Orchids at Baillonville, near Marche, Belgium, stands in high reputation. Herr Wilcke made a point of growing the *Alexandrae* altogether, and this, the weakest one, by preference. It is but justice to him, and a great pleasure, too, to dedicate to him this splendid plant. *H. G. Rehb. f.*

## THE EDINBURGH ARBORETUM.

THE laying out of the Arboretum at Inverleith Row has now made such progress that it may be hoped the grounds will be opened to the public in the ensuing summer, and be available for purposes of botanical study in the course of next year. Already it seems evident that the Arboretum will prove one of the most interesting and attractive places of resort that the citizens have at command; as not only will there be educational benefit derivable from the study of the various groups of trees and shrubs, but also much to admire in the fine views of the city and surrounding country that open out from several points. The design adopted in laying out the ground has been, first, to enclose the whole with a border belt of young trees and shrubs of the average breadth of 40 feet, protected on its outer line by a Holly hedge, and then to intersect the area with winding walks, which encircle planting plots varying from half-an-acre to 2 acres in extent.

The formation of the boundary plantation was begun by Messrs. Methven & Sons about six weeks ago, and has now been completed; and the same firm are at present digging and trenching the "corners" of seven of the inner plots, in order that these too may be planted; after which the Arboretum, it is understood, will be handed over by Her Majesty's Board of Works to the authorities of the Botanic

\* *Odontoglossum Wilckeanum*, nov. hybr. inter *O. crispum* et *Alexandrae*, vegetatio *O. crispum*.—Racem. quinquefloro, grandifloro; sepalis triangularibus, petalis multo latioribus lacero angulatis, labello basi adnato, lamina oblonga aurorsum angustata apiculata, marginibus crispatis serrulatis, callis pugionatis 3-5 utrinque in basi, carinis medianis ancipitibus antice liberis serratis, apiculo interposito; columnæ auriculis lacris. — Flores albidis-sulphurei; castaneo maculati. — Labello basi aurantiacum, ceterum albidis sulphureo, brunneo-maculatum. Inter *Odontoglossum crispum* (*Alexandrae*) introductum. — Dom. Wilcke, Orchidearum cultori egregio dicatum. Floruit apud dom. Massange. *H. G. Rehb. f.*

Gardens. In the outer belt some 9500 trees and shrubs have been placed, forming a miscellaneous collection of hardy plants, in which about 300 varieties are represented. In this plantation, which, apart from its own interest, will serve the important purpose of sheltering the inner groups, Coniferous trees form a prominent feature; and as the capabilities of several varieties which have not yet been thoroughly tested by foresters may be here brought out, valuable information will in all probability be gained by those who are charged with the care of timber-growing on estates throughout the country.

The Crimean Pine, *Abies Nordmanniana*, for example, a form of the Silver Fir which is believed by some to be even better adapted for planting in this country than the variety now in favour, has been freely introduced; and other trees that stand well out are the Cembran Pine, the Mount Atlas Cedar, the Himalayan Cedar, the Canadian Hemlock Spruce, the Archangel Spruce, the *Wellingtonia gigantea*, the Scotch Fir, grown from seed brought from Braemar; the *Pinus nobilis*, the variegated black Austrian Pine, several of the choicer Coniferous trees that have their native habitat in China and Japan, and a number of similar specimens from the north-west coast of Vancouver's Island and the north-west coast of North America. In the central plots family groups of specimen trees will be planted, including, besides the more common kinds, as many of the rarer and more costly varieties as the amount of the expected Government grants will provide.

The ground may not be fully furnished for a year or two, but in the meantime it is fortunate that a large quantity of the old timber which still stands within the Arboretum supplies considerable materials for study. In course of time these trees, where too thickly planted, as they are in many places, will be thinned out; but several of the groups of Scotch Fir, Beech, Sycamore, Elm, and Walnut, are as fine as it is possible to have. One of the Sycamores is quite a curiosity of tree life, the original trunk having been stunted in its growth, and developed into a large misshapen knot of apparently dead timber, out of which spring two thick limbs, one of them, like the parent stem, lifeless, but the other healthy and vigorous. *Scotsman*.

GARDEN GOSSIP.

BY A LADY.—II.

AN ALPINE GARDEN.—In order thoroughly to appreciate the charms of an alpine garden it is necessary to have but one house, and to live in it all the year round. What can a lady care for an alpine garden who leaves the country to go up to town for the loveliest season in the year? It is in the spring that the alpine garden is the most attractive, but its interest does not die out entirely at any season, even in the winter the evergreen foliage of Saxifrages, Sempervivums, Pinks, and many others make it lovely, when the borders, which were gay with bedding-out flowers in the autumn, show nothing but bare earth.

But the alpine garden has the greatest charms for those who like to tend their flowers themselves, for the less the gardener is admitted the better will the plants succeed. Alpines must be let alone; moreover, there are many which have a tendency to hide their heads under-ground for a great part of the year, and that not always in the winter, and these are apt to fall victims to the gardener's spade if he is allowed to interfere. Let the lady weed her own alpine garden, and if it occasionally have fresh soil (laid carefully on with a trowel round the roots of the little plants), and be well watered in dry weather, she will require very little assistance from masculine hands.

Two causes have combined to lead me to take up "alpine gardening"—one is that I do not care so much for the masses of colour in a bedded-out garden, as for the individual flowers which are used to produce them (especially, it goes to my heart to have to pick off the blossoms from plants grown only for the sake of their variegated leaves); the other is that I have taken under my special protection a small piece of terraced ground with a north-west aspect, which is so exposed to the prevailing winds that all my attempts to make a "mixed garden" of it proved failures. It was a source of perpetual disappointment to me, till the happy thought occurred of converting it into a rock garden. Alpines do well there, perhaps

on account of our elevation—about 650 feet above the sea level, and we have abundance of limestone rock close at hand, with which to plant our beds; for the natural slope is so great that there is no necessity to raise rockery. I put many of my alpines into beds which were originally made for Pelargoniums, merely sinking rocks into the soil sufficiently to protect their roots, and to keep up the general appearance of a rock garden.

But an alpine garden cannot be made in a day, except at a greater expense than is consistent with the limited means of the villa residents, for whom alone I pretend to write. To apply to a gardener to stock a garden with alpine plants so well established as to ensure flowers the first year, would entail a long bill, and even then the lady would probably have to content herself with the commonest kinds. It is better to be satisfied at first with mixing alpines with commoner flowers, and gradually to weed these out as the former get established and come into beauty. In this way alone can she avoid being asked the question which used to annoy me, "At what time of year will your garden be in beauty?"

I have found it a great interest to get my friends, when travelling abroad, to send me seeds or roots in their letters of any pretty wild flowers they come

FIG. 53.—CERASTIUM ALPINUM.

across; in this way I have established in my garden plants from the mountains of Algeria, Norway, Switzerland, &c., which have a personal and geographical interest to me, independent of their intrinsic attractions; and I find it interesting to notice the different habits of the plants from different countries. Those that have reached me from Norway are mostly identical with the mountain plants of Great Britain, but not the less acceptable in a lowland garden.

The accompanying sketch of *Cerastium alpinum* (fig. 53) is made from a plant raised from seed sent me from Norway three years ago. Like many Norwegian plants, it nestles close among the stones, as if to avoid the fury of mountain winds, the short flower-stalks bringing the dead-white starry blossoms in close contact with the rather dark foliage. It blossoms early, and is therefore valuable as helping to keep up the succession of flowers, which is one of the chief difficulties in managing an alpine garden. *A. B.*

LEPTOTES BICOLOR, from the Organ Mountains, is attractively in flower in the Cambridge Botanic Garden. Its leaves quite conceal the attachment of the plant to the block on which it grows, and resemble as much as anything a bunch of pods. From among these proceed the spikes, on which are about six open flowers; they have narrow forward-curving sepals and petals, and a painted labellum, rose-coloured about the centre. This is a very neat-looking species, and not common.

NOTES FROM SYON.

ALTHOUGH the extensive crescent-shaped range of plant-houses at Syon, known as the conservatory, is supposed to typify in a high degree the beauties of art in that particular description of garden erections, it is very doubtful whether a duplicate of such buildings will ever again be erected for plant culture even by the most enthusiastic Art-architect. In spite of all the drawbacks incidental to the culture of plants in such unsuitable houses, yet they ever possess many points of interest, and just now the horns of the crescent are full of huge Camellias remarkable for health and cleanliness, and, alas! for the paucity of bloom—in fact, where there should be thousands there are barely tens. Mr. Woodbridge tells us that this scarcity of the noble white flower is general, and that it results from the almost entire absence of sunshine and ripening heat that marked the past summer. Its effects are now seen in numerous unexpected ways.

In the central house, where Palms, Bamboos, Ferns, Musas, and plenty of other things make up a miniature tropical forest, there are plenty of features worthy of remark—the marvellous Bamboo stems almost rivalling in rapidity of growth the famous beanstalk of the fairy tale—the huge bunches of Bananas springing from the base of noble leafage—and not least, because most novel, if not particularly striking, is the yet immature fruit-spike of the *Monstera deliciosa*, which it is hoped when ripe may prove all its name implies. The effects of the tremendous hailstorm of last summer, and which committed such great devastation at Syon, are yet to be seen in the foliage of the tropical denizens of this large house, and it will be a long time ere all traces of it will be removed.

Not caring for the trouble incidental to the growth of pot Roses for the production of cut blooms, a few years since Mr. Woodbridge converted a late vinery into a Rose-house, planting his climbing Teas outside, and running them up the sloping trellis inside. Now the roof is covered nearly to the top, and of all in bloom none are more striking, perhaps none half so effective just now, as are the blooms of Cheshunt Hybrid, for the flowers are of perfect form and the colour a glorious reddish-crimson. This should form a companion Rose to *Maréchal Niel*, *Homer*, *Catherine Mermet*, and *Lamarque* in every Rose-house. Looked at from beneath, the buds do not look abundant, but step outside and cast a glance up between the roof and the trellis, and the plants are seen to be bristling with buds literally by hundreds, which will produce for a long time a grand succession of blooms.

Gardenias planted out in a raised bed along the front of a lean-to house are covered with buds, and the plants are remarkably clean. Scale and bug give no trouble, but after some three years of growth the roots will often exhibit a tendency to rust or canker, and then another succession bed is made in an adjoining house. Perhaps the most beautiful of all white flowers, equal to the snowy *Eucharis* for purity, and exceeding it in grace and elegance, are the blooms of that as yet somewhat scarce plant, *Hymenocallis macrostephana*, produced in clusters on a stout stem, and each flower having a firm stem of 6 inches in length. Although less productive of bloom at one given period, Mr. Woodbridge favours it in preference to the *Eucharis*, because it is possible with a succession of plants always to have flowers. Because of the six narrow pendent segments that project round the edge of the cup, and which serve to give such an air of elegance to the blooms for table-glasses, epergnes, or other table decorations, the flowers are less suited for packing for market than are those of the *Eucharis*, but in private establishments it presents a fine accession to white-flowering winter plants.

Owing to the vicinity of Syon to town there is a much greater demand upon the establishment for plants and other material suitable for table and house decoration than is the case where gardens are remote. Specially for table, vase, and window decoration a large number of shallow zinc pans of all sorts of needful shapes are now filled with *Selaginella*, to form a carpet of greenery. In and about this are stood large quantities of small Ferns of any diminutive species, grown in small 60's. Instead of dividing old plants and potting up, it is the practice to sow Fern seed, chiefly of *Adiantums* and *Pteris*, in pans, and when the seedlings are large enough to prick them out in tiny clumps in these little pots, and push them on in gentle heat; the tufts of Ferns thus

obtained are not only varied in foliage, but come much better and earlier than if otherwise propagated.

Amongst the hundreds of foliage plants employed, none are more elegant or graceful than small plants, about 14 inches in height, of the Screw Pine. These are raised from seed, and so produced are far more perfect and pleasing than if propagated from side shoots. A flower of singularly rich colour, quite a deep maroon-crimson, is that of the *Amaryllis formosissima*, a small species grown in 5-inch pots in the warmth of ainery, and throwing up abundant bloom. The petals are long and narrow, the entire flower as far removed as possible from the ideal of the florist, but resembling in form a huge crimson Pœa flower. It is most highly prized as a companion flower to the *Hymenocallis*, its deep rich hues showing up grandly by gaslight. A dwarf carpet plant, largely grown for vase decoration, is the compact *Pilea muscosa nana*, which does not apparently in its advanced growth exceed a height of 3 inches, and has mossy foliage of great beauty.

Some interest attaches to a couple of Pine pits now converted into early vineries; in one the Vines are planted out in a temporary bed, and in the other the Vines remain in pots. In the former house there are nearly double the number of bunches there are on the pot Vines, the wood and foliage are more robust, and the bunches larger and having finer berries. Altogether the experiment goes a long way in favour of the planting out of Vines even for temporary work, but the planted-out canes may remain another year, when they will start even earlier than they now do. A large quantity of dwarf French Beans are grown in pots; the earliest now fruiting is Osborn's Early, and it is very dwarf and even in habit. It is here preferred for the first gatherings only, as, though free, the pods are short. As a succession Improved Syon House Bean is coming on, and these, with successive sowings of the same kind, will keep up the supply till the summer.

Outside, on a south border, Canliflower plants put out in 9's under hand-lights have stood the winter well, having had no further protection than the glass. Five plants from each light will be presently taken out and planted elsewhere, and thus a good succession will be secured. Amongst the garden green crops the fog and hoar-frost have worked much mischief, Syon, from its low position near the river, being peculiarly liable to frosts. Many of the evergreen trees, the Oak especially, have largely suffered. Bays, Escallonias, Euonymus, and many fairly hardy shrubs are also severely injured, but it is too early yet to say how far things are affected by the winter, which seems to have done quite enough harm here already.

## ARTIFICIAL MANURES.

A RECENTLY published report by Dr. Voelcker to the Council of the Royal Agricultural Society respecting the merits of certain artificial manures submitted to him for analysis by members of that Society, exhibits in a most deplorable way the sort of commercial morality that appears to exist amongst some manufacturers and dealers in these manurial articles. In numerous cases the prices charged to the members were more than double and treble that awarded by the eminent analyst as being its manual and mercantile value. One manure, sold at £14 per ton, is estimated at £8; another, at £13, at £5; another, at £5, as hardly worth 2s.; another, sold at £8, as not worth £2; and so on. It is fortunate for farmers who are large consumers of these manures that through the instrumentality of the Royal Agricultural Society, if they are members of that society, they are protected against the unmitigated rascality that is by Dr. Voelcker so ably exposed. Gardeners of all sections are also fast becoming large consumers of artificial manures, and every few weeks some fresh article is being offered to their notice as possessing certain valuable and indeed almost magical properties. In one sense gardeners can fairly protect themselves by purchasing only a small portion of any kind and testing its usefulness; but it is none the less desirable that they should also know something of the nature of the article they are purchasing before using it too largely. Why cannot horticulture have its analytical chemist, to whom could be submitted for test all the hundred and one manures now in commerce? To obtain a certificate of value from a qualified chemist should be the aim of

all dealers, and if the sample received by the purchaser was not equal to the guarantee, the purchaser should be entitled to recover from the vendor. Some such action as this would serve to show gardeners that they too were protected.

## RAISING SEEDLING

### ABUTILONS.

THE incidents which have led up to the production of some very fine and useful forms of the Abutilon by Mr. J. George, of Putney Heath, make up a particularly interesting chapter of the records of floricultural work done by raisers in the present generation. What he has done—and his successful work sprung more from a happy accident than from any design he had planned—was commenced in a spirit of trust and hope, which reaped abundantly of the harvest he wished might follow.

"With trembling hand  
'Tis ours a little seed to sow;  
Knowing the law will firmly stand  
That bids it into richness grow."

In April, 1877, Mr. George noticed a pod of seed on one of two varieties of the Abutilon he then had in cultivation. They were the orange-flowered *A. Darwinii* and the pure white *Boule de Neige*, but at this distance of time he has forgotten which of these was the seed-parent, and he made no record of it at the time. He infers that the one had been fertilised with the pollen of the other, possibly by the intervention of some insect or other cause. The seed was sown as soon as gathered, and some fifty plants resulted. The seed was placed in a temperature of from 60° to 65°, and the seedlings kept there till the plants were 6 inches in height, and they were then shifted into 32-sized pots, in which the plants flowered. The first to bloom opened its blossoms in the latter part of July; and the plants were then nice healthy specimens about 18 inches in height. From this batch of plants he had flowers of several shades of orange, and these varied in shape and size, as would probably be the case in the instance of a cross between the long-petalled *Boule de Neige* and the short-petalled *Darwinii*; there were also shades of rose, and rose and salmon, varying also in shape and size, but no white. Of this batch of seedlings a few varieties were named, and in February, 1878, four of them were selected for distribution by Messrs. Osborn & Sons, of the Fulham Nurseries: one of these, named *Lady of the Lake*, was awarded a First-class Certificate of Merit at the spring show of the Royal Botanic Society, held soon after.

Seeing so much had resulted from chance fertilisation, Mr. George was led to think much more of benefit might result from artificial impregnation. This was resorted to, in a manner which has not been recorded; and in April, 1878, another batch of seed was sown, which resulted as before, in producing much variation in colour and form; but, singular to state, only one or two of the seedlings came white flowered, although the pollen of *Boule de Neige* was freely used. From this batch Messrs. Osborn & Sons selected six varieties in the September following, when they bloomed, and which were distributed the following spring.

Having among these a seedling with small flowers, but with more of red in the colour than Mr. George had yet met with, on this he tried the pollen of *Hibiscus sinensis*, and not, as he thinks, without result, as he states "The plant is quite distinct from any other I have, the flowers being above the average size, as well as richer in colour." Another seedling has flowers of even a richer and deeper colour, but the blooms are much smaller and more globular, like the *Darwinii* type. This, with the preceding, has been secured by Mr. Cannell.

Mr. George quite endorses the opinion that the Abutilon should be grown as an autumn and winter-flowering plant. The blooms come much better in colour, and, indeed, in every respect, than when the plants flower in hot weather under glass. He also states that the best time for sowing seeds is in April or May, and the plants will bloom in the months of September and October following, and continue to flower all the winter, if kept in a temperature of from 55° to 60°. Mr. George uses for the culture of the Abutilon a compost made up of loam, leaf soil, peat, and a little sand. *A. D.*

## JAPANESE CONIFERS.—X.

(Continued from p. 275.)

*PICEA GLEHNII*\*.—This is a dwarf dense growing Spruce, with spreading branches and red, hairy or almost shaggy, shoots. The cones are sometimes very small, and resemble those of *P. obovata*. It was first discovered in the island of Sachalin, by Schmidt, and subsequently in the south-east coast of Yesso, by Maries, by whom seeds were sent to Messrs. Veitch, who are, we believe, in possession of living plants. It also occurs, if we are correct in our identification of Maack's specimen, in Amurland.

Branches spreading, cylindrical, with short internodes, reddish, covered with shaggy down; smaller branches given off at an angle of about 50°; pulvini or cushions oblong-linear, the free portions twisted on the under surface.

Buds subglobose, scales resinous, brown, ovate, the outer ones thick and cushion-like, so that there is a more abrupt transition between the pulvini and the thin bud-scales than usual, and the bud in consequence appears as if imbedded in the end of the branch.

Leaves crowded, in many rows, ascending at an angle of about 45°, curved, linear, 4-sided, sharply pointed, concave portions slightly glaucous, convex portions green. Internal structure as in *Alcockiana* and *obovata*.

Cones 1—2 inches by 5—10 lines, linear-oblong, cylindrical, or ovate-oblong; scales leathery, slightly striated, light brown above, darker at the base and wedge-shaped, upper free portion rounded, denticulate; bracts much shorter than the scale, broadly lanceolate, denticulate.

Seeds 3—4 lines long, wings obliquely ovate, membranous, pale brown.

This plant resembles a dwarf form of *Alcockiana* or of *obovata*, but it may be distinguished from the former by the hairy branches, by the pulvini, which are less prominent and scarcely obovoid, by the thinner cone scales, persistent bracts and wider wing to the seed. From *P. obovata* it differs in the pulvini, and in the shorter and broader wing to the seeds (Schmidt). The cones vary considerably in size, some being very small. The scales in the case of old cones are ragged and recurved at the margin, so that at first sight they appear pointed. *M. T. M.*

## PRUNING PALM ROOTS.

SOME little interest having been excited by this subject in your columns of late, I may perhaps be allowed to express a few words by way of caution to those who would undertake the operation. Your correspondents who have related their experience have doubtless succeeded in attaining their end, but that such has been the case with every one who has tried the practice I should greatly doubt. That it can be done in many cases with benefit is well known in certain classes of Palms, but in others it is a mere process of destruction. I have found, as a rule, that many Palms, although of easy cultivation, will not bear to have their roots disturbed, and since residing in the tropics I have had no cause to change my opinion, but in almost every case I have had it strengthened. That they will stand a fair amount of hardship while their roots are intact is not disputed, provided the supply of heat and moisture suitable to their various requirements be adequate; but that they will stand an indiscriminate slicing or pruning is far more than my experience leads me to believe.

Although they may appear to the eye to be in good health, and even making fair progress, it will be found in many cases that the following result takes place after the system of root-pruning has been adopted, especially in those species having large succulent roots. If attentively examined it will be found that where the roots have been injured either by a clean or ragged cut, no matter which, that their centre dies, and gradually induces decay, which, running through the main roots, in the end reaches the centre of the stem, causing decay there also. This is first noticed in the fact that the centre or axis is very slow in producing leaves. The young growth then decays, leaving a hollow stem, which is generally attributed to the plant having had too much

\* 1866. AMES GLEHNII, Fr. Schmidt, Reise in Amurland und auf der Insel Sachalin, 1868, p. 176, fig. (Mem. Acad. Imp. Sc. Petersb., VII. ser., I. xii., n. 2 (1866)). Hab.—In ins. Sachalin, Fr. Schmidt, in herb. Kew!; in ins. Yezo, Maries, n. 72!; ad fluv. Ussur, Maack!

water overhead, the outside leaves continuing for some months in apparently the best of health, being supported by those fibrous roots which escaped injury.

Palms as a rule will stand being pot-bound for a considerable length of time, and when planted from pots into the open do not suffer so much as exogenous plants that have been similarly treated, on account of their new main feeders being produced in concentric circles from their outer base, which again is a part of their system very liable to injury. The roots spread or ramify outside the pot-bound mass, and are therefore secure from the inevitable strangulation which attends the roots of most exogens when allowed to be planted in that condition.

A singular instance of the hardship undergone by a Palm may be seen on the wharf of the Royal Mail Steamship Company in Kingston. The plant is a male of *Phoenix dactylifera*, and is growing

### Forestry.

VALUE OF SCOTCH FIR PLANTATIONS AT FIFTY YEARS' GROWTH.—I have taken the liberty of altering the title of the subject of discussion, and my reason for so doing is that others may more distinctly see what is and wherein lies the difference between Mr. Smith and myself. At p. 238 Mr. Smith expresses regret at my not furnishing him with statements, other and better than I have done, of the woods and plantations in Stathspey and Banffshire. Now I always like to give a reason for my doing, or not doing, as the case may be, and in the present instance my reason for not giving a more flourishing account, or one different, from that adduced, is simply because I have none to give.

I have traversed the woodlands and forests of Dulnanside hundreds of times, and I can assure Mr. Smith his ideal or apocryphal plantation is not to be

Mr. Smith incidentally refers to and deprecates my system or practice of thinning. Well, I will at the proper time refer again to that subject, and go into details with Mr. Smith if he wishes it, but it may in the meantime be left in abeyance.

Mr. Smith also demurs to the low prices of wood, and says that while I get 6*d.* per foot for Fir, he, or some else gets 1*s.* 2*d.* per foot. Now on this head I have respectfully to ask Mr. Smith who is paying or receiving 1*s.* 2*d.* per cubic foot for wood of trees containing only 7 cubic feet of timber, and not over fifty years old? I know of no such market, and may add I never did. The wood of such trees is too soft and young to command such a price, and also of too small size.

Mr. Smith again reflects seriously upon me for not getting higher prices for the wood sold, and my defence under that charge is, that I invariably get

FIG. 54.—*PICEA GLEHNII*: BRANCH AND CONE NAT. SIZE; SHOOT, DETACHED LEAVES, SCALES, AND SEEDS, MAGN. TWICE; TRANSVERSE SECTION OF LEAF HIGHLY MAGN. (SEE P. 300.)

near the sea. Annually the stem of this Palm is covered up with steam-coal 15 to 25 feet high, the moisture of which causes it to produce large quantities of fibrous roots at varying heights, which hang in tangled masses when the coals are removed. Being uncovered sometimes for months, and exposed to a dry atmosphere, they of course lose all vitality, only however to be renewed by a succeeding batch when the stem is again surrounded with coal, the growth and appearance of the tree in the meantime seemingly not altered in the least; which I think may be accounted for from the fact that the roots produced in the coals are simply auxiliaries, the main feeders which form the principal support to the plant being in the natural soil of the shore, and uninjured. *J. Hart, King's House, Kingston, Jamaica.*

EARLY LEAFING.—Near the veteran Eucalyptus at Kew, which we are pleased to see has not been materially injured by the frost, is a Horse Chestnut which some ten days ago had already expanded its first leaves. *Ribes speciosum* against a wall was almost in full leaf.

ound there. I have also seen, and in many cases closely inspected the best and most important subjects on both sides of the Spey from Badenoch to Garmouth, embracing of course the far-famed and justly celebrated forests of Glen Fishie, Rothiemurens, Glenmore, and Abernethy, but all in vain have I looked for the thing that is not there, never was, and probably never will be. Again at Cullen House, where the woodlands are admittedly as extensive, varied, and valuable, as any in the county, there is no subject there to be met with to satisfy Mr. Smith either now or probably hereafter unless he will greatly modify his demands and come down from the regions of vision where he dwells. Mr. Smith's good common sense and wisdom might show him that witnesses in giving evidence are sworn to tell the truth, the whole truth, and nothing but the truth; and as he and I stand in a similar attitude towards each other, and to the public as well, we are bound to be faithful and true, according to the best of our knowledge and belief, let the issues be what they may.

as much as I can, but I never get more than purchasers are pleased to give; and if Mr. Smith will inform me how and when to get more, I shall be very much indebted to him.

Depasturing plantations with sheep, &c., is a subject of no small importance, and requires a true and faithful record and representation in all its phases; and it might be safer for Mr. Smith to defer his conclusions until he has more fully ascertained all particulars, both as to the amount of damage done by sheep to the trees after fifteen years' growth, and other neglects. I entirely disagree with Mr. Smith as to his computation of the value of evidence, when in substance he says mine loses half its value for want of quantity, for I had always thought evidence was more valued for its quality than quantity. This point, however, I will not further dispute if Mr. Smith contends for it.

On what estate, and in what parish, I again humbly ask, is the 20 acres of Scots Fir plantation at fifty years' growth value £2000 to be found? If Mr.

Smith really knows of such a plantation, he need not be ashamed to point to it. I think Mr. Smith will agree with me that it will be more convenient and edifying to all concerned if we confine our remarks as closely as possible to the subject in hand, and not traverse at one time the whole domain of forestry, as we should be led to do by following the outline of his concluding observations. I am neither weary nor impatient of this discussion, but shall gladly say good-bye to it when I have seen on the ground, or even know where I can see for myself, a Scots Fir plantation, of 20 acres less or more, growing upon moorland known as barren and worthless, not over fifty years old, and worth as a marketable subject, not £131 14s. 6d. per acre, according to Mr. Smith's estimate, but the modest sum of £50 per acre, including value of thinnings throughout, but deducting expenses of labour of thinning. *C. F. Michie, Cullen House, Cullen, Banffshire.*

## Florists' Flowers.

SEASONABLE NOTES ON GREENHOUSE FLORISTS' FLOWERS.—AZALEAS.—As soon as the first flowers open on any plants in the forcing-house let them be removed at once to the greenhouse to open gradually. Those still in the forcing-house had better not be subjected to too much artificial heat; syringe occasionally to maintain a healthy state of growth in the plants. Those plants in the greenhouse that are allowed to open their flowers without forcing must be well supplied with water at the roots. Fumigate to prevent the attacks of insect pests, or to destroy them.

### BEGONIAS.

In the case of the tuberous-rooted section, it is necessary to place the pots containing the tubers in a warm house now, if it is intended to flower the plants early. The plan I adopted last year was to shake the plants out of the soil as soon as they started, repotting in smaller pots than those they flowered in the previous year. As the Begonia is a succulent rapid growing plant after it starts, it is very desirable to place the plants near the glass to cause a stocky growth, and also stout healthy leaves. Place the pots containing the tubers for late flowering on a shelf near the glass and supply them with water.

### CALCEOLARIAS.

Examine the large plants in their flowering pots frequently. When the plants are well grown a mass of large healthy leaves quite covers the surface of the soil in the pots at this time; these may look all right from a casual glance, but it is very desirable to see that there is no decay underneath, which soon spreads, to the serious injury of the plants. It is there that greenfly appears, and it must be destroyed now else it will scarcely be prevented from destroying or at least seriously crippling the plants. Late seedlings may yet be potted. Shade from very bright sunshine coming suddenly on the plants this month.

### CHINESE PRIMULAS.

If the plants are now near the glass and air is freely admitted without allowing gusts of wind to blow upon the plants, the flowers will continue to open freely, bright in colour, and of good quality. Give occasional waterings of weak manure-water.

### CINERARIAS.

See that the large specimen plants now coming into flower are not placed too close together. Even if the stage is near the glass, it is still desirable to place the plants on inverted flower-pots, as the air circulates most freely underneath them; tie the trusses into their places, give very weak manure-water at each alternate watering. Mildew and greenfly must both be carefully guarded against. The plants require a plentiful supply of fresh air, but drying winds cause the leaves to flag when the plants are not suffering from want of water at the roots.

### CYCLAMENS.

These beautiful plants are now in full bloom, and most beautiful they look either arranged in groups or as isolated specimens amongst other plants. If any of the flowers are required the stems must not be cut or broken; pull them out from the corm, the old cut stems rot and are injurious. Place any superior varieties by themselves, out of the influence of the ordinary stock. If such plants are placed on a shelf near the glass they will produce seeds. By a little care in this

way good varieties can be reproduced very nearly true from seeds. Continue to prick off seedlings into thumb-pots as they become large enough.

### FUCHSIAS.

The plants start very freely in a gentle heat, and as soon as it is seen that the buds have started turn the plants out, reduce the balls, and pot in the same sized pots. The plants delight in being dewed overhead with rain-water slightly warm. Take cuttings as soon as the shoots are 2 inches long, and strike them in a gentle bottom-heat. This plant does not like too much heat, and it objects to a stagnant atmosphere.

### HYACINTHS.

The house ought to be quite gay with this queen of spring flowers now, and there ought to be a good display for the next five weeks. By what I have seen of them this year I should say the bloom will be much under the average; for this there can be no help, as well-ripened bulbs are essential to the production of good spikes, and we could not have this essential, neither did we obtain a good potful of roots before the plants were removed indoors. Those who have to force their plants a little to get them in by a certain date for exhibition must place them near the glass, and bring them on very gently at first. Give weak manure-water at every watering. Polyanthus Narcissi, and early flowering Tulips require very similar treatment to Hyacinths.

### PELARGONIUMS, LARGE-FLOWERED.

In this class is included the "decorative" section. March is a month when the lack of attention or mistake in management may ruin the prospects of a good blooming period. Water has been applied with caution hitherto, and probably some of the plants have become rather too dry near the base of the ball, where the greatest portion of roots are. Give each plant a thorough soaking with rain-water slightly warmed. Specimen plants for the May shows are in that stage that the shoots must be fixed in proper position, using sticks to hold any fractious growths in their place. Cleanse the foliage from dust and dirt, by giving the plants a thorough syringing. Now is the time to cleanse them from aphides by fumigating. The growths of any plants intended to flower in July should now be stopped; these should be the latest potted plants. Fancy varieties require in all respects similar treatment, nor must it be forgotten that they can do with a higher temperature.

### PELARGONIUMS, ZONAL.

In recommending these as decorative subjects for the greenhouse of the highest class, the aim of the cultivator ought to be directed to producing a good display of flowers at a time when the garden is not over-coloured with the bedding varieties out-of-doors. Specimen plants for the summer exhibitions will require to be trained as recommended for the other sections; the other treatment will be the same, but insect pests are not to be feared. Small plants to be grown into flowering specimens by the end of the season should be placed near the glass, a little heat will cause a more rapid growth, and the points of the shoots must be pinched out to produce bushy specimens.

### VERBENAS AND PETUNIAS.

These plants may be placed together as far as cultural requirements at this season are concerned. The Verbena is much more liable to the attacks of greenfly, and if this pest, with mildew, is kept from the leaves the culture is easy enough. Like all rapid growing plants the principal thing is to see that after the plants start growing they do not receive a check from any cause. It would not yet be too late to put in cuttings to produce good flowering specimens this season. If the cuttings put in early have not been potted off see that it is done as soon as they are fairly rooted; those that have been potted off should be placed on the shelf in some cool house or greenhouse, but they will be none the worse if just a little heat is applied to cause a more free growth. *J. Douglas, Loxford.*

FREMONTIA CALIFORNICA.—We grieve to see this fine and very interesting shrub so severely hurt against one of the walls at Kew—hurt, we fear, beyond recovery, as the main stem is split from top to bottom, and the side branches are completely killed. No means were apparently taken to protect the stem of the tree.

## Garden Operations.

### FLOWER GARDEN, ETC.

I would reiterate the desirability of at once completing all shrub pruning, hedge cutting, shrubbery clearing up, and pointing over, turf laying, levelling, and sowing grass seeds, verge cutting and rolling, walk repairing and re-surfacing with gravel, all of which operations, if left beyond this period, I look upon as "extras" that interrupt routine duties, and which are now presented in plenty, one of the first being attention to the welfare of spring flowers and bulbs. Beds containing these require pointing over, and in some instances picking over, to remove the decayed foliage, for the frost has been rather severe on Myosotis, Wallflowers, Silenes, &c.; others again, having been upheaved by frost require well pressing in the soil, whilst Hyacinths and Tulips that are very forward should have some slight protection in frosty weather. Such autumn-sown annuals as have survived the winter should be thinned out and fresh patches planted with the thinnings, or, what would be a better plan to give a succession of flowers, make fresh sowings, and thin out as soon as the seedlings can be handled. For this mode of culture, and to sow now, the following are well adapted:—Candytufts, Clarkias, Collinsias, Eschscholtzias, Godetias, Larkspurs, Limnanthes, Mignonette, Nemophilas, Silenes, and Virginian Stock.

The hardy fernery and rockwork now require their annual putting in order. In the former remove the dead fronds and protective mulching, and with a hand-fork stir up the soil and remove weeds, also give additional soil to such plants as are likely to be benefited by it, and re-arrange and make additions as desired. Amongst the hardy Ferns at this place we have clumps of Snowdrops, Daffodils, wild Hyacinths, Primroses, and Foxgloves; they seem quite at home among the Ferns, and add interest to the scene. Rockwork gardens require similar attention as to the general clearance of weeds and pointing over, but with the exercise of additional care. All the plants will now safely transplant, and most of them increase by division, which may also now be done. The addition of a few shrubs will relieve the baldness of the scene.

Beds and borders that have been filled with plants for winter effect only, being now vacant, should be got in readiness for the summer bedders, by digging or trenching, as may be demanded by the nature of the intended occupants; and this suggests that summer bedding arrangements should now be settled, not only for the reason that the beds may be appropriately prepared, but that the right number of plants may be forthcoming at planting time by an early commencement of propagation, which is easy enough in itself, the difficulty being room to grow on the plants till putting out time, in which strait most gardeners are compelled to have recourse to inventiveness, such as at this season planting out Calceolarias and Verbenas in the newly prepared Celery trenches, and covering up with mats at night, or planting them at the foot of south walls that are protected, and utilising the frames they have occupied for the planting out of Lobelias, Petunias, and the like, and by other modes, scheming and contriving to find space for the desired number of plants.

Plants that have been wintered in out-of-the-way places must now be brought out and placed in a growing position and genial temperature. Among these are Dahlias, *Salvia patens*, herbaceous Lobelias, Marvel of Peru, Cannas, and herbaceous Begonias, these latter are likely to prove popular for bedding purposes, as the flowers withstand the rain better than Pelargoniums. A frame should be prepared in which to sow Asters, Stocks, Zinnias, Everlastings, Tagetes, Lobelia, and Pyrethrum. Bottom-heat is not essential, but a more kindly germination would be ensured if a little were afforded by the making up of a bed of leaves, and placing on it about 4 inches of light soil—loam and leaf soil in equal parts. Keep the soil moist by an occasional syringing and the frame closed till the seedlings appear, when ventilation must be freely given. In the South of England Pyrethrum, if sown now on a south border in the open ground, will be in ample time for bedding purposes. *W. Wildsmith, Hockfield.*

### HARDY FRUIT GARDEN.

The effects of the odd blinks of sunshine with which we are favoured are already becoming visible in the swelling of the buds of fruit trees trained, not only upon walls, but also upon standards in the open garden. The work of pruning and nailing will therefore have to be pushed forward with all despatch, so that the latter operation, if performed by juniors, will not be rendered more difficult by an inherent dread of doing mischief to the buds, which will now develop rapidly with increasing warmth. It cannot be doubted that the longer the branches of fruit trees

can be kept from close contact with the walls the greater will be the probability of obtaining a crop, for if the blossoms are only retarded from opening for a few days they may just escape a period of inclement weather. Where the walls are wired, and two or three competent hands can be spared who are acquainted with the work of training, I should have no hesitation in allowing trees of Peaches, Nectarines, and Apricots to remain untied until the pink pips are visible in the buds. It is a prudent course to keep the work well in hand. My experience of wired walls has not been extensive enough to warrant me in forming a definite opinion upon the question of injury or non-injury to the branches of trees by direct contact with the wire, but with this exception—a vital one it must be admitted—the system has everything else in its favour. It may be necessary this season to make sacrifices in pruning, which those who are behind with their work will now have the opportunity of doing by a close inspection of Plums and Apricots; these frequently have the best show of fruit on spurs, which certainly do not adorn a tree, but under the existing state of affairs it would be a culpable act to remove them for the mere sake of appearance. Peaches and Nectarines will require more thinning than what is technically understood as pruning or shortening back the branches. There should be no hesitation about a thorough thinning out of unripened and weakly shoots so long as there is a base left for furnishing the trees afresh with wood which it is to be hoped will be better matured during the present year. Overcrowding the shoots is a misfortune in any case, and it will be especially so during the present year after the ordeal the trees have passed through. The same remarks will apply with nearly equal force to the pruning of Morello Cherries, which although not work of a very pressing nature as yet, will nevertheless demand early attention.

The rapacity of birds for the buds of fruit trees in this district is so desperate, that I find shooting is the only effectual remedy for them. Late pruning or netting is the best mode of protection for Gooseberries and other small fruits. Raspberries should be pruned, and the roots thinned out where it is considered necessary. Give a good coating of rich manure on the surface after the ground is cleared of weeds and slightly pricked over with a five-pronged fork. Strawberry plantations should be hoed between the lines, and the plants divested of dead leaves, afterwards giving them a good mulching of cow-manure, if the soil is poor, and if not, a less rich application of lighter material will be equally beneficial in so far as it retains moisture, encourages surface roots, and presents a better surface to the action of the sun. *W. Hinds, Canford Manor.*

#### FRUIT HOUSES.

VINES.—Where spring planting is anticipated, preparations should be made for turning out the young Vines early in April. In all cases where the houses are arranged for external and internal borders the Vines should have the run of the inside border only the first year, and this need not exceed 4 feet in width to start with. Directions as to the formation of Vine borders, as well as the quality of the compost, having been so frequently given in these pages, that it is not necessary to enter into details here, the main points being thorough drainage, sound turfy loam in a rough state, crushed bones, and some kind of gritty matter for keeping it sweet and open. If cut-back Vines of last season are to be planted they may be shaken out and placed in position either before they commence growth or after the buds have broken; in the latter case the soil should be allowed to become moderately dry and warm before the roots are placed upon it. Cover lightly at first, and give a little water at a temperature of 85° to 90° to settle the soil about them. Should eyes of the current year be decided upon, I should give preference to Mr. Thomson's system of striking them in thin squares of turf placed close together over bottom-heat, but owing to the length of time it takes to get them into free growth and fit for planting out, it will not be necessary to proceed with the new borders quite so early. It will, however, be of great service to them if the compost can be well warmed ready for their reception by the time the roots have found their way through the sods. When well carried out this system will fill a house with clean healthy young rods in one season. Grapes now in bloom will require a night temperature of 65° to 70° with a circulation of air at all times; run up to 80° by day and 85° to 90° from sun-heat. Fertilise Muscats with foreign pollen, using a camel-hair pencil in preference to drawing the hand down the bunches, as the latter when the body is warm sometimes produces small brown spots on the point of the berries which greatly disfigure the appearance of the Grapes when ripe. All late Grapes, particularly Muscats, Gros Colmar, and Black Morocco, which require plenty of time, should now be on the move. Many Grape growers condemn the latter as being a shy setter, with us it sets as freely as a Hamburg. It requires a sound deep internal border resting on good drainage, abundance of water

when growing, and careful fertilisation when in flower. Vines intended for fruiting in pots next year should now be fit for the final shift. Use good rough turfy loam, crushed bones and a little old rubble to keep it open. Let the pots, 12 inches in diameter, be clean and well crocked; pot firmly; half plunge in a bottom-heat of 80°; keep them close, and shade them from bright sunshine for a few days. *W. Coleman, Eastnor Castle.*

#### CUCUMBERS.

To plants in full bearing give copious supplies of tepid liquid manure in a weak state. Where the drainage is ample, and the plants are making a free growth, there will be no occasion to apprehend danger through applying this stimulant too frequently to the roots. Let the night temperature range from 65° to 70°, and from 75° to 85° with sun, running up to 90° after being shut up with plenty of moisture in the house. The old lateral shoots and leaves of established plants should be gradually removed to make room for the young growths as they push forth from the principal leading shoots. These should be tied—leaving sufficient space between the ligature and the shoots for the development of the latter—and trained regularly but not too closely over the trellis, so that the shoots individually may be exposed to the influence of light and air, which will cause a consolidated growth. Young plants will now require due attention; the plants having been previously stopped on attaining the third wire of the trellis the young lateral growths resulting therefrom must be trained to their allotted position. A little soil of the same composition as previously recommended can be placed about the hillocks now, and must be added to as the roots push through the soil, and until the allotted space is filled. Make, where considered necessary, successional sowings and plantings. See that the linings of hotbeds are duly attended to, and should any rank steam be likely to arise in the frame at night it will be advisable to tilt the sashes up sufficiently high to allow of its escaping. Let a quantity of fermenting material be kept in readiness in the reserve yard for present and future use. *H. W. Ward, Longford Castle.*

#### MELONS.

Plants growing in hot-water and dung pits, and which have been stopped some time since, will now require to have their laterals arranged, three or four of which—all the superfluous shoots being pinched out—should be trained regularly over the surface of the bed, and stopped when they have made eighteen or twenty inches of growth, which will result in the production of fruit-bearing shoots. Impregnate the blossoms on fine days when the pollen is dry, and maintain, as far as practicable, a rather dry atmosphere while the plants are in this interesting stage of growth, until they have set their fruits. Stop the shoots at one joint beyond the fruits, which, when they are thoroughly set, and have commenced swelling off, should be thinned out, leaving four of the best and most even-sized fruit on each plant, having the same as regularly distributed over each plant as possible. It will be advisable on bright mornings to put a chink of air on when the thermometer registers 75°, which, moreover, should be added to progressively as the temperature of the house increases, and *vice versa*. Maintain a bottom-heat of from 75° to 85°, with a night temperature of 65° to 70° according to the external condition of the weather, and 75° without sun by day, running up 10° with sun. Shut up the house at 85° on bright days, and run up to 90° with plenty of atmospheric moisture. Add some soil of the same description as that in which the plants are growing to the hillocks as soon as the roots protrude through the sides of the mound, and tread it firmly together. Successional sowings and plantings must now and for the next few months be made in accordance with the prospective demands for the Melon in each individual establishment. Let the linings of dung-frames in which Melons are growing be duly attended to. *H. W. Ward, Longford Castle.*

#### PLANT HOUSES.

FERNERIES.—Ferns of most kinds are now on the move, and it is high time, therefore, that the whole stock should receive an overhauling, as, although only a portion may require repotting, the remainder will be greatly benefited by receiving a surfacing of fresh soil, especially in the case of all such as are planted out in artificial rockwork and grown after the natural manner. It generally happens with these, after having been kept somewhat dry for the winter, that the mass of earth shrinks away from the sides of the pockets, leaving cavities down which the water courses without benefiting the roots. To prevent this it is very important that these vacant spaces be filled in at once—an operation that may best be done by means of a stout flat stick, using for the purpose a mixture of dry turfy loam and peat, which may be rammed in firm and all made secure. This done and

a top-dressing given, the next thing is to turn on the hose, or with the garden engine or a coarse-rosed pot administer sufficient water to thoroughly soak and settle the whole body of soil, but beyond removing any dead or shabby fronds the less trimming the plants have for the present the better. In regard to the pot kinds that are used for special purposes, such as table decoration or for furnishing vases, when they have to be kept to a limited size, it will be found that their health will be improved by reducing the old balls as much as possible, even to the sacrificing of a good portion of the roots, that they may have fresh soil afforded, which for the *Gymnogrammas* and other choice kinds should have a little finely broken charcoal or cinders, with a fair sprinkling of sharp sand mixed in to keep it open and porous—a condition that is very essential for the successful cultivation of Ferns. Where it is desired to increase any of the kinds quickly recourse must be had to division, to which most submit readily, especially *Adiantums* and others of that class, which may be split up into small pieces by cutting right through the crowns with a large sharp knife, but the safest way to deal with *Gleichenias* and such as have hard wiry rhizomes like them, is to layer any portion that may stray beyond the pots or can be brought there, when after a time they will become established, and may be severed at once. Seedlings of most sorts are always useful, and the raising them from spores is a very easy matter and a most interesting occupation. To make sure of getting the seed to germinate freely, 6 inch pots should be prepared by putting plenty of drainage into them, on which some tough fibry loam should be rammed firmly, leaving the surface even where the spores are to be placed, and then covered by laying a sheet of glass over the top. The pots must then be set in shallow pans kept constantly supplied with water, which the crocks will draw up gradually, and keep the soil in a regular moist condition. Any light shady place in the stove or other warm house will do to stand them in, although the brisker the heat the quicker will the seedlings come.

#### GREENHOUSES.

These structures will now be gay with a miscellaneous variety of things, from which some or other are being turned out as they go out of bloom, a time in a general way when they lose a good deal of attention, and have to shift for themselves. Much of this arises from want of space to accommodate them, but it is a matter of the greatest importance that even the hardiest of plants which have been forced should have some shelter, and be well treated till their growth is complete, and the weather is such that they can be trusted out without the protection of glass. *Epacris*, and the early-flowering, free-growing *Heaths*, such as *hyemalis*, *gracilis*, *melanthera*, and others, although impatient of artificial heat and confinement later on, are greatly benefited by being stood where they can get a little warmth and a moist atmosphere now after being cut back, as it is of much assistance in giving them a fresh start, and as soon as they get this it will be a good time for repotting. This should be done in the best fibry peat, made as firm as possible by the use of well-prepared potting stick, solidity of the soil being very necessary for all plants having such fine hairlike roots as the above-named.

*Pelargoniums* of the show and fancy class will now require close watching for greenfly, as at this season they breed and spread at a rapid rate, and soon cripple the tips of the shoots, to prevent which a whiff of smoke should be given occasionally, and to insure a stocky short-jointed growth the plants must be elevated so as to enjoy full light, and be allowed plenty of space between that the under leaves may have their share of sun and air, without which they soon lose colour, and become disfigured by spots. The zonal section, so valuable for coming in during the summer and autumn, should now be set to work by shaking-out and repotting such old stock as have been saved from last year, plants of these being much the best for yielding a fine display of bloom early, which they do if not shortened back to any great extent, and are placed where they can get a dry heat of 45° to 50°, with free ventilation, as when so accommodated, the growth they make is exceedingly solid and very floriferous. To have *Cinerarias* and *Primulas* when they are of most service—in the dead of winter—seed must be sown at once, and for successional again later on. The double kinds of the latter are so beautiful and useful for cutting as to be deserving of the most extended cultivation, but unfortunately these can only be propagated by offsets, which require great care to get them to strike. To aid them in doing this the plants should be rested for a time by being kept dry, when the side shoots should be taken off with as much of the old stem with each as can be obtained, and inserted singly, after being properly trimmed, in small pots containing light peaty soil with plenty of sand, and if these are then placed under handlights in a warm dry house on a slate near the glass out of reach of the sun, they will emit roots in a few weeks and be ready for shifting on and growing in any cold frame. *J. Sheppard, Woolverstone.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 8	Sale of Imported Orchids, at Stevens' Rooms.
TUESDAY, Mar. 9	Royal Horticultural Society: Meeting of Fruit and Floral Committees, at 4 A.M.; Scientific Committee, at 4 P.M.
WEDNESDAY, Mar. 10	Sale of Established Orchids, Imported Lilies, and other Roots, at Stevens' Rooms.
THURSDAY, Mar. 11	Sale of Imported Orchids, at Stevens' Rooms.
FRIDAY, Mar. 12	Sale of Scientific Instruments, &c., at Stevens' Rooms.
SATURDAY, Mar. 13	Sale of Hardy Shrubs, Fruit Trees, Roses, &c., at Stevens' Rooms.

READERS of this journal some quarter of a century ago will remember the frequent references made at that time to the excellent work done by the late Professor HENSLOW. That great-hearted man did not confine himself to the duties of a Professor of Botany in the University of Cambridge, nor even to the ordinary duties of a conscientious parish priest. It is needless for us to say how thoroughly those duties were fulfilled—his memory still lives in the minds of those who had the good fortune to know him and his works. But there is one phase of his life-work which circumstances have brought to our notice, and to which we deem it well again to refer. We allude to the instruction he gave to the village children of his parish in natural history, and especially in botany. To make peasant children spell out such words as "Dicotyledon," "Phanerogamia," and the thousand similar hard words which constitute the language of botany might seem to superficial thinkers but an empty and an irksome task. HENSLOW, however, thought otherwise; he took care to teach the meaning of the language he used, or rather he made the children by gentle insistence and genial persuasion, find out for themselves the real meaning and significance of these words. No man better than he recognised the three-fold nature of his pupils—the sensual, the intellectual, the spiritual. By directing and guiding the first—cultivating and fostering the spirit of curiosity and interest in children, in other words by stimulating the faculty of observation which every child has, in its degree, as a natural heritage, he let loose the spring of their intellectual faculties and, unconsciously it may be, developed their reflective intellectual powers. Through these he pointed the way to yet higher spiritual truths which many endeavour to instil by dogmatic means, more calculated to engender superstition than a purer apprehension and a more intelligently felt reverence.

Be this as it may, no one knew better than he the value of botanical training for children, or did more to practise what he felt. What better training can there be for the majority of children than one which first attracts attention by dealing with the natural objects so dear to every child, then systematising the observations which every child makes, and ultimately leading them to reflect and reason upon sound bases?

What study is more calculated than that of natural history to engross the sympathies of the child or the youth, and to debar the growth of lower and debasing tendencies? From the physical point of view, what better exercise for the body than that involved in the outdoor study of natural history? What is true of natural history generally is specially true of botany. Impediments and obstacles of various kinds prevent the introduction of other branches of natural science into village schools, but the fields and the hedgerows, the woods and the

gardens, supply means for study and recreation which are always at hand, which require no expensive apparatus for their elucidation, no practices which can offend the prejudice or hurt the sensibilities of any one. From this point of view it is gratifying to see the son of the late Prof. HENSLOW treading in the steps of his father, and following an example, than which he could have none better, by publishing a little volume expressly intended for the instruction of children in the elements of botany. Mr. HENSLOW'S plan is to take a number of well selected wild flowers and pull them to pieces, so as to show their construction, compare one with the other, illustrate their uses, and suggest, rather than enunciate the wide-embracing principles which flow naturally out of these apparently simple matters. It is an incontrovertible truth that the life-history of the meanest weed that grows, the lowest creature that has life, involves considerations more pregnant with important issues to the human race and to all the dwellers upon this planet than the march of an ALEXANDER or the decree of a CÆSAR. A study of the methods and aims of natural science is, therefore, all-important, while for those whose business leads them to deal in an especial manner with living things no training is more important than one in the elements of biology, of which science, for the reasons we have hinted at, the department of botany must have the preference. Young gardeners, especially, should familiarise themselves early with the elements, and constantly increase their knowledge of vegetable form and of vegetable physiology. The illustration at p. 309, which serves as a frontispiece to the work we have mentioned, will serve to recall to many the good work done in times past in the most simple and unpretending manner. That others may be stimulated to take up the work and continue it in every village school, is a consummation devoutly to be wished.

— A TEMPLE GARDEN IN JAPAN.—The view which we are enabled to give of a temple garden near Yokohama (fig. 55) is taken from one of the series of very interesting photographs brought home from Japan by Mr. MARIES. To the left is seen the entrance to a temple, with large bronze lamps on either side. Standing a little back in front of the central edifice is a tree of *Pinus Massoniana* with the branches trailed on a trellis, according to the Japanese custom. To the reader's right is a bell-tower, and in the centre is a magnificent specimen of *Cycas revoluta*, with a branching trunk, and surrounded by a low railing. Some idea of the climate may be gained from the circumstance that this tree grows in the open air, protected during the winter by a few mats. The fierce sunlight and the deep blue sky, indicative of atmospheric purity, are sufficient in the warmer months so to build up the tree and strengthen its tissues as to enable it to resist the winter's cold. The strikingly picturesque buildings might well serve as models for summer-houses, boat-houses, and the like. Temple bells are, Mr. MOSELEY tells us, always hung in a separate building and never far from the ground—2 or 3 feet only. They never have clappers, but are rung by means of a long beam slung at two points by ropes. The beam is drawn back and allowed to swing with its end against the bell. The temple roofs show well the catenary curve preserved in all Chinese and Japanese roofs, probably copied originally from tents, the ancestors of the Japanese having been nomadic.

— HELLEBORES.—At Kew a bed has been made for these at the Richmond end of the herbaceous ground, sheltered by the pretty rockwork in that situation. The sorts now in bloom are *niger*, *niger* var. *major*, *lividus*, *fetidus*, *atrurubens*; and very many others are just showing bloom.

— LABEL FOR BOTANIC GARDENS.—We lately saw a good form of label at Kew, devised, we believe, by Sir JOSEPH HOOKER. It consisted of a rod of iron some 2 feet in length, the thickness of the

\* *Botany for Children*. By the REV. GEORGE HENSLOW. (STANFORD.)

little finger, and expanding at the top into an oblong or square frame, into a groove of which is slipped one of MAW'S tile-labels, with the name permanently imprinted on it. At a little distance the rods are scarcely perceptible, while the label itself is easily read, and yet is not large enough to be a disight.

— THE NEW FOREST.—According to the *Journal of Forestry*—a publication which increases in value with every succeeding number—the income of this national forest amounts to £8930 6s. 8d., and the expenditure to £8876 7s.; giving the utterly ridiculous sum of £53 19s. 8d. as the annual rental or profit derived by the State from this splendid but wretchedly mismanaged national property. This sum represents a rental of less than one farthing per acre. The new Deputy-Surveyor, the Hon. GERALD LASCELLES, is well spoken of by our contemporary, as having had a good training for the office to which he has been appointed.

— POST OFFICE REGULATION.—Great inconvenience is sometimes experienced by advertisers and others by overlooking the rule of the Post Office, which forbids the postmaster to receive letters addressed by initial or fictitious name only. Thus a letter addressed "A. B., Post Office, Chelsea," or wherever it may be, will not be received, but will be sent at once to the Returned Letter Office.

— CAMELLIAS OUT-OF-DOORS.—The Camellias planted out at Kew have not been greatly injured during the winter, although some of them have dropped their leaves.

— DR. BOISDUVAL.—The French papers announce the death of this learned entomologist, to whose labours we owe one of the best treatises on the insects which affect garden plants. Dr. BOISDUVAL was an ardent horticulturist, and a leading man for some time at the Central Horticultural Society of France. He died in his eighty-second year.

— OLD SEED.—It may be expected that a considerable portion of old seed will be sent out this spring, to compensate, in a measure, for the scanty supplies of fresh seed last autumn. So long as the seed in question is not so old as to have lost its germinating power, it may be considered fortunate if the merchants are able to furnish their clients at all. The age of seeds may be determined (according to M. LADUREAU, in the *Annales Agronomiques*) by chemical analysis. Fresh seeds contain a neutral oil, which becomes more and more acid in proportion to the length of time the seed is kept. The increased acidity coincides with a diminished germinative power. The simple test of growing a few as a sample is, however, a better test, and one within the reach of every cultivator. Well ripened dry seeds undergo chemical change less rapidly than seeds under the opposite condition, and retain their power of growth in proportion.

— FUCHSIA EARL OF BEACONSFIELD.—For the information of a correspondent of the *American Gardener's Monthly*—who asks in what year this Fuchsia was raised, and who was its raiser?—we may state that it was raised some seven or eight years ago at the Forest Hill nursery of Messrs. JOHN LAING & Co. Mr. LAING fertilised flowers of the old *Fuchsia fulgens* with the pollen of some of the best florists' varieties of that day, and in due time raised about a hundred seedling plants, amongst which were some very curious things—which were subsequently thrown away—and the subject of this note, which was certificated by the Royal Botanic Society on June 21, 1876, under the name of Laing's Hybrid, and again in July of the following year by the Floral Committee, under the name it now bears. It is undoubtedly one of the most beautiful and most useful decorative varieties that we have, but it has one fault, and a very curious one—it will not bear seeds.

— HARDY PLANTS IN BLOOM AT KEW.—We saw the first common Coltsfoot in bloom a week or so since at Kew, together with *Petasites albus*, *Colchicum bulbocodioides*, *lusitanicum*; *Crocus Imperati*—one of the most lovely of all, *C. Olivieri*, *etruscus*, *alatavicus*, *susianus*, and *chrysanthus*; *Bulbocodium vernum*. Among the Saxifragas were *oppositifolia* and the white variety *Rocheliana*, and the lovely *Burscriana*, alluded to in another column.

— THE WINTER AND THE CONIFERS.—At Kew recently we noticed that the following species had lost their leaves or been more or less injured:—*Pinus Sabiniana*, *P. Webbiana*; *Abies bracteata*, *A. Pin-sapo*, *A. bifida*; *Picea Smithiana*, *Cedrus Deodara*, *Sequoia gigantea* (*Wellingtonia*).

— FRAME POTATOS.—It has long been a moot-point between various schools of Potato cultivators as to whether deep or shallow planting was most adaptable to the nature of the Potato, and which most calculated to produce a good crop of tubers. As far as regards the best method of planting frames for the obtaining of early forced crops, the practice long adopted by Mr. DENNING at Coombe Gardens seems to present very strong evidence of the value of shallow

remain until they are more advanced in growth, and thus make up a successional planting. This routine of potting and planting begins early in the year, and continues as long as required. Most advanced cultivators of Potatos now advocate the tubers being well prepared, shallow planting, late enough to avoid late spring frosts, and two or three earthings, as being promotive of early cropping and avoidance of disease.

— SEEDLING DISAS AND DROSERAS AT GLASNEVIN.—There is at present in one of the span-roofed pits here a sight which we venture to assert could not be witnessed elsewhere in Ireland, nor perhaps in England either, namely, a large seed-pan full of *Disa grandiflora*. There are several hundreds in the pan, in fact it closely resembles a good "hit" of *Lobelia*

ornamental forms are easily raised from seed. Fine shrubs of *Eranthemum pulchellum* have long been in bloom; another blue is supplied by the useful *Conoclinium*, and among the softer rose tints of several *Centradenias* a scarlet *Negelia* shows with considerable brilliancy. *Toxicophlea spectabilis* is much superior to any white *Lora*, and possesses a delicious fragrance. *Eranthemum Ecbolium* remains continually in flower; growing beneath the stages there is always a succession of shoots. Passing a few other showy flowers, among which is a good form of *Imantophyllum miniatum*, we light upon a rarity in the shape of *Begonia albo-coccinea*, introduced some years ago by Messrs. VEITCH, now prettily in flower, as it has been all the winter. Its leaves are very ornamental and distinct, appearing like those of a

FIG. 55.—A TEMPLE GARDEN NEAR YODOHAMA. (SEE P. 304)

planting. Mr. DENNING plants all his Potato tubers intended for frame-work first in small pots, the top of the tuber just projecting from the soil. In this way the only the roots that are developed at the base of the shoots are enticed into the soil, whilst all the tuber rootlets remain exposed to the air. When the plants are about 8 inches in height they are planted out in frames 10 inches apart each way, the tuber rootlets being just buried. The stems afterwards receive two earthings by added soil of about 1 inch each in thickness; and "the result of this mode of culture," says Mr. DENNING, "is that the young tubers are produced far earlier, are finer, and there is a better and more regular crop than is found where the tubers are planted perhaps from 4 to 5 inches deep at the first." This plan, it is evident, admits of the strongest being selected to plant up together, and the weaker ones

*speciosa*. Already Mr. MOORE has been successful in transferring some of the tiny seedlings to another pan, and they appear not to have felt the disturbance in the least. We also noticed a pan of *Drosera spatulata*, containing some hundreds of plants, all of them fit for transplanting—in fact some had already been transplanted. *Gardeners' Record*.

— *LIBONIA FLORIBUNDA* is extremely fine in colour and development in the stove of the Cambridge Botanic Garden. Its flowers show a deep red colour, unlike that of the smaller yellowish ones usually seen. This peculiarity has been noticed, and the question is suggested whether *Libonia* is so properly a greenhouse plant as usually supposed, being much finer in this case with warmer treatment. Several seedling *Abutilons* in this house are sufficient to show that

small *Nelumbium*. The charm of its flowers is in the pretty combination of white and red, the outside surfaces of the buds and flowers being deep red, the inner pure white. It is a native of India.

— REMOVAL OF AN OLD YEW TREE.—A correspondent informs us that the famous old Yew tree in the churchyard of Buckland, near Dover, has been moved to a position some 60 feet westward of its previous site. The tree is of very ancient date, and is supposed to be one of the oldest in the United Kingdom. In course of time the roots had become deeply embedded in the soil, and the earth was first entrenched all round to a depth of some 5 feet, and then boxed, as it were, with deal boards. An easy incline towards the west was constructed, up which, after rollers had been introduced under the box by pulleys

and other mechanical appliances, the tree, with its earth as it stood, was hauled and placed into position by means of one of Mr. W. BARRON'S Elvaston transplanting machines. We should deem the removal of such a tree with such a history an act of sacrilege, and should the death of the tree result, as is only too probable, those who counselled it will have but a tarnished reputation. We sincerely hope that our correspondent may have been misinformed, and that no such gross Vandalism has been perpetrated. The custom of planting Yew trees in churchyards is a subject which has given rise to much anti-quarian discussion, and it is said that the original purpose was to protect the church from storms, though some assert to provide the parishioners with bows when the practice of archery was so much followed. Several ancient laws were enacted for the encouragement of archery, which regulated many particulars relating to bows, but it does not appear that any statute directed the cultivation of the Yew. Although the scarcity of bow-staves is a frequent subject of complaint in our ancient laws, yet, instead of ordering the Yew tree to be cultivated at home foreign merchants were obliged, under heavy penalties, to import the material from abroad. On the other hand, a statute of EDWARD I., which settles the property of trees in churchyards, recites that they were often planted to defend the church from high winds, and the clergy are requested to cut them down for the repairs of the chancel of the church whenever required. It is said the custom of planting Yews in churchyards singly is of very ancient date. STATIUS in his *Thebaid* calls it the solitary Yew, and it was at one time as common in the churchyards of Italy as it is now in North and South Wales. In many villages of those two provinces the Yew tree and the church are coeval with each other.

— *EREMURUS TURKESTANICUS*.—This is a fine Lilaceous plant, bulbs of which were sent by Dr. ALBERT REGEL from Turkestan, and which is figured in the *Gartenflora* for January. Although not so fine a species as *E. robustus*, it is a very ornamental plant for warm situations. It requires, however, a warmer drier summer than we enjoy in this country, and therefore it is very suitable for pot culture. The flower-spikes, irrespective of the naked part of the scape, are about 2 feet long, and the flowers are copper-coloured bordered with white. It is in the hands of Messrs. HAAGE & SCHMIDT.

— *EPPING FOREST*.—We note, for the information of those who may care to read *in extenso* the paper read before the Society of Arts, on January 28, on "The Future of Epping Forest," that Messrs. WILLIAM PAUL & SON have reprinted it in pamphlet form, and we advise all those interested to read and profit by it.

— *ASPLENIUM PRENTICEI*.—This is an Australian Fern, described as a new species by Mr. M. BAILEY in the *Proceedings of the Linnean Society of New South Wales*, vol. iv., p. 37. The author states that it is a very distinct species, in habit resembling *Lomaria discolor*. It inhabits the deep gullies of the Trinity Bay range.

— *OPIMUM IN CHINA*.—Recent reports from China show that the cultivation of the Poppy, and the manufacture of opium, is still increasing in that country; consequently the returns of some of the Chinese ports show a decrease in the quantity of Indian opium, which, however, is compensated for by the increased production of the native drug. Malwa opium has hitherto been—and, indeed, is still—in greater demand than any other Indian opiums in China, but the Persian kind is, it seems, now rapidly taking its place. Regarding the moral aspect of the question of opium smoking, the British Consul at Kiungehow says it must be treated as any other necessary evil that legislation cannot prevent. Compared with drink, one contrast is very marked—it has not produced one-half the misery or crime. A pipe of opium is by some considered to the Chinese workman what a glass of beer is to the English labourer—a climatic necessity; and, accepting facts as they are, that their use has become so engrained that one must look to the spread of education only to prevent abuse.

— *AMPHISCOPHA POHLIANA*.—This Brazilian Acanthad is decidedly worthy of general cultivation

as a decorative stove plant. It flowers well, even in a young state, and the combination of dark glossy green leaves, deep red bracts, and purple flowers, renders it strikingly handsome. It is of a neat dwarf habit, the somewhat large leaves are sessile, and narrowed to both ends. The branches are terminated by a closely packed, cone-like mass of somewhat large, deep red, imbricated bracts, which, even without the long purple flowers, are sufficiently showy to render the plant a conspicuous one. It only needs to be known to be more largely grown. There are now several specimens in bloom in the Palm-house and elsewhere at Kew.

— *PRIMULA NIVEA* AS FURNISHING WHITE FLOWERS.—Plants of this species cultivated in pots, if strong and well-established, will furnish a large number of flowers at this season of the year in a cold greenhouse. It can be cultivated by those who have no convenience for forcing into bloom such things as *Deutzia*, *Prunus*, *Eucharis*, *Tulips*, &c., which supply white flowers at this season of the year. *P. nivea* grows generously, and flowers with remarkable freedom, and the blossoms being produced in neat trusses can be used in many ways. In a free soil and a somewhat dry position, it will live through an ordinary winter; but to have it in all its snowy purity, it should be cultivated in pots through the winter in an ordinary cold frame.

— ILLUSTRATIONS OF AUSTRALIAN ORCHIDS.—Part v. of FITZGERALD'S magnificent work on *Australian Orchids* reached this country by the last mail, and its value, as descriptive not only of the mere form but of the life history of the plants, is of a very high order. We have already alluded to the absence of numeration of the plates and pagination of the text, and as each part appears it becomes more and more difficult to find a particular plate. What the final arrangement is to be the author does not say. The part before us contains figures of *Prasophyllum fimbriatum*, *P. nigricans*, *Thelymitra nuda*, *Sarcophilus falcatus*, *S. olivaceus*, *S. Hillii*, *Pterostylis curta*, *P. pedunculata*, *P. reflexa*, *P. acuminata*, *Caladenia corulea*, *C. deformis*, *Cleisostoma tridentatum*, and *Bolbophyllum Sheperdi* (*sic*), besides the following new ones:—*Thelymitra megacalyptra*, *Sarcophilus montanus*, and *Dendrobium falcostrostratum*. The last named plant is a large-growing white-flowered species discovered by the author, and first described by him in the *Sydney Mail* newspaper! The flowers are of medium size and produced in numerous large panicles, and they are said to exhale a delicious perfume, distinct from that of any other Australian species. The flowers of *Prasophyllum fimbriatum* are not resupinate, hence the labellum is uppermost, and, being irritable when an insect alights on the outside, or what would be termed the under side of it, it is at once thrown forward upon the column, closing the flower for an hour or two. With the exception of the *Dendrobium* none of the epiphytes figured in this part are very showy. *Cleisostoma tridentatum* is described as a veritable air-plant, sometimes hanging and flourishing by a single thread-like root. It is, however, only found on trees overhanging streams.

— *TYPHONIUM DIVARICATUM*.—Specimens of this somewhat rare, extremely interesting, and pretty Aroid, are now in flower in the T range at Kew. Were it not for its abominable odour, the gracefully formed and richly coloured spathes would recommend it for more general cultivation. It is a stemless herb with cordate acuminate leaves, somewhat less than those of the common *Arum maculatum*; the recurved spathe is longer than the erect subulate spadix, the latter as well as the inside of the spathe being of a beautiful deep crimson colour. A native of Malabar, and, according to ROXBURGH'S *Flora Indica*, of China also, as plants of it were received at the Calcutta Botanic Gardens which had been sent from Canton by Mr. W. KERR.

— EXOTIC PLANTS NATURALISED IN QUEENSLAND.—The last volume of the *Proceedings of the Linnean Society of New South Wales* contains an interesting article by Mr. F. M. BAILEY, on some of the introduced plants of Queensland, from which it appears that the character of the flora is undergoing a rapid change. Many foreign plants, be they accidentally introduced weeds, be they ornamental, and first cultivated in gardens, spread over the country in

a surprisingly short period. Some of them prove formidable enemies to the cultivators of the soil, whilst others add to the charms of the native flora. To the latter category belong such plants as *Ricinus communis*, several varieties of which have established themselves on the railway banks and elsewhere, and are exceedingly effective. *Passiflora edulis* has become one of the commonest climbing plants in the scrubs. Mr. BAILEY remarks that a more acceptable example of acclimatisation could hardly be found, as its fruit is abundant, ripens readily, and proves most acceptable to the traveller. *Ageratum conyzoides* is already widely spread, as is likewise *Lantana camara*, whose beautiful and abundant flowers hardly compensate for the extent of good land it occupies. The pretty *Asclepias curassavica* has overrun the whole colony, and from a welcome visitor it has sunk to the rank of a perfect nuisance. Nothing seems to feed on it except an aphid, which has no power to destroy, and a butterfly, supposed to have been introduced. *Opuntia vulgaris* has spread widely and rapidly in Queensland, and in New South Wales, especially along the Upper Hunter River, its spread is described as really formidable. The beautiful *Solanum sodomæum*, with orange-coloured fruits, has become very common in the forest country. The Watercress (*Nasturtium officinale*) has become naturalised in many streams, and is regarded as a most wholesome and useful plant. *Centaurea melitensis*, *Verbena bonariensis*, *Datura Stramonium*, and *Medicago denticulata*, are some of the most troublesome weeds. On the other hand, *Carduus Marianus* has proved a great boon in dry seasons; for when pasturage is scarce, horses, cattle, and sheep, eat it readily, and thrive upon it. Mr. BAILEY states that during some recent droughts horses became quite used to knocking the seeds out of the dry flower-heads, ate them with a great relish, and even fattened upon them. The Horehound is naturalised only near stockyards, and some of the graziers consider it as very beneficial to sheep.

— A MIDLAND COUNTIES POTATO EXHIBITION.—This is an appropriate title for an exhibition of Potatoes under the auspices of the Harborne and District Potato Society, to take place in the Masonic Hall, Harborne, on September 17 and 18. There are not less than twenty-seven classes for Potatoes, a considerable number being for single dishes of specified varieties. In one class prizes are offered for the best dish of cooked Potatoes, one variety only, to be judged just as they are cooked, the competing tubers to be handed to the committee at 12 o'clock noon precisely on the first day of the show. It would appear that a society has been formed at Harborne, called The Harborne and District Potato Society, there being a number of Potato fanciers in the neighbourhood; and the schedule of prizes is a very straightforward attempt not only to encourage good cultivation, but to discourage as far as possible errors and confusion in nomenclature. One rule states that every dish of Potatoes must be correctly named, or it will be disqualified. Only one other feature besides Potatoes is included in the schedule of prizes, and that is a class for twelve blooms of Dahlias, distinct varieties, correctly named; and for three, Mr. E. CHATWIN offers a first prize of not less than 30 cwt. of best coal. There should be a huge competition in this class. Potato exhibitions are on the increase, and the Borough of Hackney Chrysanthemum Society, whose exhibitions take place at the Royal Aquarium, have added some good classes for Potatoes, as well as for collections of vegetables, to the schedule of prizes to be given at their annual exhibition in November next.

— PITURI: A NEW NARCOTIC.—It is a marvellous circumstance that the black man of Central Australia should have dropped upon the same narcotic principle (nicotine) as the red man of America. The forest is the home of the native, and there the white man often feels his own inferiority—as the native often puts himself on a meal under circumstances where the white man would starve. As a hunter the black man is perfection itself. These remarks occur in a paper read before the Queensland Philosophical Society by Dr. BANCROFT, who there adds materially to our information concerning the Pituri, or Pitchery, of Central Australia. Pituri is a plant not far removed from the Tobacco plant which grows in Central Australia. The leaves of the

plant are chewed, by the aborigines who trade with it far and wide. The plant yielding it has been determined by Baron VON MUELLER to be the *Anthocercis* or *Duboisia Hopwoodii*, *alias* *D. Pituri*. Chemical analysis shows that the alkaloid, on which the peculiar poisonous properties depend, is nicotine, the same substance to which Tobacco owes its effects. *Pituri* causes extreme retraction of the eyeballs. It is much sought after by the natives, who will give anything they possess for it, not for the purpose of exciting their courage, or of working them up to fighting pitch, but to produce a voluptuous dreamy sensation, such as the opium eater experiences. The natives in some districts are said never to travel without it on their long marches, using it constantly to deaden the cravings of hunger and to support them under excessive fatigue. KING, the survivor of the BURKE and WILLS expedition, who had lived seven months with these natives when rescued by HOWITT, states that when his food became so scarce and bad as barely to support life he sometimes obtained a chew of *Pituri*, which soon caused him to forget his hunger and the miseries of his position. It also plays an important part in the social rites of these natives. At their big talks and feasts the *Pitchiri* (for it is spelt also in this way) "quid" is ceremoniously passed from mouth to mouth, each member of the tribe having a chew, from the "pinaroo"-man or head-man downwards. This singular wassail cup never fails to promote mirth and good fellowship, or to loosen the tongues of the eloquent. There is a curious mode of greeting on Cooper's Creek. When friends meet they salute with, "Gaou, gaou"—"Peace, peace"; and forthwith exchange *Pitchiri* quids, which, when well chewed, are returned to their owners' ears. They extended this custom to their European visitors; but the fullest appreciation of their hospitality in offering their highly-prized, and, indeed, only stimulant, could never overcome their repugnance to the nauseous morsels, hot and steaming from their mouths, of the natives.

— VERONICA TRAVERSII.—We are glad once more to note that this fine New Zealand shrub has passed the winter quite unhurt at Kew.

— MR. BOYD'S ORCHIDS.—We hear that Mr. ANDERSON, of Meadowbank, has purchased the entire collection of Orchids of Mr. W. B. BOYD, of Ormiston House, Kelso, at a very considerable outlay, and is now distributing the plants to those who desire to participate in the sale. They are said to be about the best grown little lot of Orchids to be met with, the credit of bringing them to this condition being due to Mr. FAIRBAIRN, formerly gardener at Syon House.

— A SEEDLING LACHENALIA.—We have received from the Rev. J. G. NELSON, of Aldborough Rectory, Norwich, a seedling *Lachenalia*, raised between *aurea* and *luteola*, which will be a welcome addition to our limited stock of these pretty Cape bulbs, and which appears to combine the rich yellow of *luteola* with the free-flowering and free-growing habit of the latter. We believe Mr. NELSON intends exhibiting his nursling at South Kensington on Tuesday next; and it would be a welcome addition if any one who has a collection or good examples of *Lachenalias* would show them at the same meeting. In the case of Mr. NELSON's seedling, *aurea* was the male parent and *luteola* the female. The seed was sown in the autumn of 1877, and the batch of seedlings are blooming in the spring of 1880, which is pretty quick work for a bulb. We should like to hear the experience of our readers in growing *Lachenalias*. Some, as *aurea*, have the property of taking long rests, lying dormant for a whole season, and many persons fail in keeping them in health. From our own observations of fifty years since, when we knew of some which were admirably cultivated in the window of an ordinary living-room, we are inclined to think they like a drier atmosphere than they generally get.

— ACACIA LONGIFOLIA VAR. NUCRONATA.—This pretty Australian species merits mention on account of its being the earliest bloomer among the *Acacias* in the Temperate-house at Kew. It is a somewhat dense-habited shrub, with linear phyllodes, from the axils of which, near the tips of the branches, spring a profusion of spikes of pale lemon blossoms. This species is totally uninjured by the severity of the

past season—several times the house was much below the freezing-point—whilst the Silver Wattle, *Acacia dealbata*, alike remarkable for its magnificent panicles of golden-yellow flowers and the elegance of its Fern-like foliage, has suffered severely.

— BILLBERGIA LIBONIANA.—Among the large collections of Bromeliaceæ at the Royal Gardens, Kew, the species at present most worthy of note is *Billbergia Liboniana*. It is easily cultivated, is not of large size, and flowers freely during the winter season. The plant is caespitose in habit, producing an abundance of runners, which furnish numerous rosettes of green leaves. From the centres of these rosettes spring the scapes bearing the handsome flowers, 2 inches or more in length; the outer perianth segments, which are of a beautiful coral-red colour, are about half as long as the inner ones, which are whitish at the base, and a splendid purple-blue upwards. A native of Brazil, from whence it was introduced to Europe by the collector in whose honour it is named. MORREN, in the *Belgique Horticole* for 1877, says that it is apparently very rare in its native country, as LIBON found but a single plant of it, and the species is wanting in herbaria.

— SCOTTISH PANSY SOCIETY.—The thirty-sixth annual competition of this Society is announced to be held in the Calton Convening Room, Waterloo Place, Edinburgh, on June 18.

— CHERTSEY AND DISTRICT HORTICULTURAL SOCIETY.—The summer exhibition is fixed to be held at Mount Felix, Walton-on-Thames, on Thursday, June 17.

— WESTON-SUPER-MARE AND EAST SOMERSET HORTICULTURAL SOCIETY.—Tuesday, August 10, is the day fixed for holding this Society's annual show.

— MAIDENHEAD HORTICULTURAL SOCIETY.—The annual show of this Society will take place in the Hambletonian Grand Hall, Maidenhead, on Wednesday, August 25.

— PUBLICATIONS RECEIVED.—DICKENS' *Dictionary of Continental Railways, Steamboats, &c.* (London, C. DICKENS, 26, Wellington Street).—*Strawberries all the Year Round*. By WILLIAM HINDS, gardener to Sir IVOR B. GUEST, Bart., Canford Manor, Wimborne.—*Fifth Annual Report of the Board of Commissioners of the Department of Parks for the City of Boston, U.S.A.*—*The Valley Farmer: a Monthly Live-stock and Poultry Magazine*, published at Staunton, Virginia, U.S.A.

— THE WEATHER.—General remarks on the weather during the week ending March 1, issued by the Meteorological Office, London:—The weather has been very boisterous, changeable, and showery in all the western and northern parts of the kingdom, with some hail and snow at many of the Irish, Scotch, and northern English stations; in the east and south, however, the weather, though squally and unsettled, was less disturbed, and the amount of rainfall was comparatively slight. The temperature was about equal to the mean in "England, S.W.," but slightly above it in all other districts, the excess being greatest, 3°, in "Ireland, N." The highest of the maxima were registered in most places on the 28th or 29th ult.; at Durham the thermometer went as high as 58°, but no higher than 55° or 56° at any other station. A rather sharp frost occurred over central and eastern England on the 25th, the lowest reading observed being 26° at Shrewsbury. The wind at the commencement of the period was northerly or north-easterly, but from the 25th to the 28th it varied in direction between W. and N.W., and on the two following days between W. and S.W. In force it was (except on the 24th) fresh or strong very generally; hard gales were frequently experienced on all our western and northern coasts, and occasionally in the S. and S.E. also. The rainfall was rather more than the mean in Ireland, in "Scotland, W.," and "England, N.W.;" equal to the mean in "Scotland, E.;" and below it in all other parts of the country.

— GARDENING APPOINTMENTS.—Mr. F. MORRIS, late Foreman at High Cross, Framfield, has been appointed Gardener to J. EBDEN, Esq., Coghurst Hall, Hastings.

## Home Correspondence.

Green Glass.—I am not sufficiently learned in the history of glass-making to know when crown glass was first made of a green colour, or whether at the time it was made for any special purpose. In a paper in the *Gardeners' Chronicle* of January 31, Mr. Maurice B. Adams, when speaking of plants requiring artificial shade to protect them from the scorching heat-rays of the sun, and referring to the shading of large hothouses such as the Palm-house at Kew, says "It would be almost impracticable to adopt any system of shades or blinds which would be effective, and it was therefore thought possible that by the aid of tinted glass, which should not in itself be objectionable in appearance, the most scorching of the heat-rays might be arrested. Mr. R. Hunt made the suggestion, associated with Sir Wm. Hooker and Dr. Lindley. The glass eventually used, after a long series of experiments, is that which we now see employed in the Palm-stove and several of the buildings at Kew, and which I am informed by Mr. Smith (my successor), the able Curator, is in every way a success." For Mr. Adams' better information, I will briefly state my first acquaintance and subsequent connection with green glass. On my entering the service of the Royal Forcing Garden at Kensington, in 1820, new pits were being erected for rearing the young Pine-apple plants, and when the pits were ready for glazing I was sent to a glass warehouse in St. Martin's Lane, accompanied by a man with a spring cart to take charge of, and bring home, the glass, which had been previously ordered; and well do I remember the dark sombre green the glass presented on my seeing it in bulk. The glass was selected by Mr. W. T. Aiton (then Director of the Royal Gardens), who called it Stourbridge green. On my coming to Kew I found most of the original plant and fruit-houses glazed with green glass. There was then no fixed material used for shading: occasionally on very bright days in summer one or more mats were thrown over the roof above any special plants that it was supposed would suffer from the burning rays of the sun; this was specially the case with the propagating-house, in which there was a pit 20 feet in length and 7 feet wide, containing 200 bell-glasses for striking cuttings, and mats were thrown over the roof, often causing the breakage of the glass. To obviate this I, in 1824, received Mr. Aiton's sanction to use canvas, for which I had 3 feet 7 inch rollers made, to work in sockets and fixed to the rafters inside the house, and to these the canvas was attached. This was the first canvas shading used in Kew. At this time the glazing was done by contract, under the supervision of the Board of Works, and it followed that in repairs clear glass was often used, which with the original green glass gave to the houses a motley look. In time clear glass became general, especially after 1845, when the duty was taken off. At this time the improvement in the hothouses commenced under Sir W. J. Hooker, and clear glass was used; then canvas shading became absolutely necessary in the Orchid, Fern, and other tropical plant houses, and it has continued to the present time; but I must say that, even with the green glass, as used in the Palm-house, shading is necessary for Orchids, Ferns, &c.; and the reason why such was not found out in early times, is because there were but few of these plants then in cultivation. Now with regard to the glass used for the Palm-house: the erection of that building commenced in the autumn of 1844, and was not finished until the summer of 1848, during which time all the details as regards the mode of heating, degree of temperature, airing, and supply of water were arranged. On this point Sir Wm. Hooker says, "they all (*i.e.*, the architects and contractors for the building) acted in concert with the Director and Curator of the establishment, who are responsible for the successful cultivation of the plants." As much of the "successful cultivation" depends upon the proper adaptation of the above points, which, whether good or bad, the Curator would have to make the best of, Mr. Richard Turner, the contractor for the building, was directed to consult me on all these points. The mode of ventilation was arranged to be as it now is, but my plan of arranging the pipes for heating was not adopted, and the unnatural iron-grate flooring (strongly opposed by me) was adopted. With regard to the glass: on my asking Turner what kind he was going to use, he said, "Oh, it will be so clear that you won't see that glass is there!" My answer was, "This will be very pretty, but how is it to be shaded in summer? for if not shaded by some material the plants will be all scorched;" and I called his attention to the plant-houses in the garden being covered with movable canvas shades during summer. This both he and I saw readily could not be done in the Palm-house; but as a substitute I suggested that the heat-rays of the sun would be greatly reduced by passing through green-tinted glass. After many *pros* and *cons* by all parties regarding the glass to be used, the Commissioner of Works demed it expe-

dient to take scientific opinion upon the subject, and accordingly the matter was placed in the hands of Mr. R. Hunt, of the Geological Survey, to whom I was ordered to send leaves of Palms, to enable him to experimentally determine the best glass medium that would check the burning rays, so as to prevent the leaves of the Palms being scorched; at the same time I was requested to furnish him with specimens of the green glass originally used at Kew, of which I found squares still remaining in one of the old fruit houses. In due time he furnished an elaborate report, which it is not necessary here to remark upon: it simply ended by recommending the glass tinted green, as in the samples sent. By this decision, Mr. Aiton's "Stourbridge green" in its old age officially received the stamp of science. *J. Smith, Ex-Curator of Royal Gardens, Kew.* P.S. See my remarks on shading in *Ferns, British and Foreign* (p. 336), and I may add that in tropical houses, especially for Ferns, Orchids, and other epiphytes, one-half the glass now used in the roof and sides might be dispensed with. The question is, What would be the best opaque material for the other half, to range alternately with the green glass? *J. S.*

**Tree Pæonies.**—I can verify the hardiness of the tree Pæony as well as M. Baumann, for within 10 feet of them here Portugal Laurels and Rhododendron Nobleum are killed to the ground. Not even the extreme points were injured, though the thermometer in sight of them registered fully 10° below zero. As Mr. Fortune observes, the early spring frosts do most damage after the growth begins, as they do to many of our Conifers, &c., though otherwise quite hardy. *Henry Knight, Floors.*

**Some Notes on the Season.**—Among the anomalies of the fruit season of 1879-80, I noticed that the very late sorts of Pears generally bore much more than the ordinary productive and earlier ones. I should not attach much value to this, but that the same thing occurred in the case of others; and on no theory is it clear to me why, for example, Duchesse de Mouchy and La Quintime, as also Marie Guise—all three very late and really worthless sorts—bore well, and not only so on one exposition, but on various. Probably these are naturally hardy setters, but there is not sun enough in our climate to ripen them, and so the lesson (if any) to be learnt is to select hardy setters of their bloom-buds. Wind and rain, I find, cause more ruin than dry frosts. *M. C. Brabant.*

**Broccoli.**—There can be no question, I think, but that the tenderness of these in ordinary seasons arises in a great measure from over-cultivation, as I have always found those on poor hard soils in exposed situations stand the winter far better than others in good rich land, where they make huge soft stems and leaves full of sap, with little of the hard fibre so essential to enable them to endure the vicissitudes of the weather. This was forcibly brought under my notice some years ago when the bulk of our plants were killed, but all those standing within the influence of a large Cedar of Lebanon and partly starved by the roots escaped, although they were on the north side of the tree. Their immunity from injury was therefore entirely owing to the comparatively stunted growth they made, and the consequent hardness of the tissues, which rendered them proof against frost. There is a vast difference too in the enduring powers of the principal sorts, the most reliable that I have met with in that respect being Cattel's Eclipse, a most valuable late variety, turning in with close heavy heads long after the greater part of the others are over. Mr. Gilbert's plan of planting Broccoli after other crops without digging the land is a good one, and if more practised losses amongst them would be considerably less, as it induces a sturdiness of habit unattainable in any other way. The next best system of culture is in rows at wide intervals, so as to admit plenty of sun and light between, as it is a well-known fact that Broccoli always stand better in open fields than they do in walled-in gardens. I was surprised to see by the letter of a correspondent that such tender early sorts as Veitch's Autumn, Osborn's, and Penzance had escaped with him. We have these, Snow's, and Backhouse's laid in and protected by straw, but I do not think they would have been saved without. I hear this is how all the market growers about Cambridge manage theirs, but it is to be feared that the supply will be a poor one everywhere this year, as even old Cabbage stumps are killed, and gardens present a generally bare appearance, with but few vegetables of any kind to gladden the eye. *J. S.*

**Novelty in the Chinese Primrose.**—The new "punctated" or speckled flowers recently introduced from the Continent offer some distinctive, and, to those who do not judge Primulas solely by a florists' ideal, very attractive features. Any break in this beautiful winter flower that gives variety in colour, marking, and form can secure abundant admiration, but in

depth of colour without doubt is seen the most attractive point. The new Chiswick Red simply presents a very deepened hue of madder on the old carmine, but one of the more novel punctated forms gives quite a maroon-shaded crimson, not all of one hue but flaked and flaked, and showing the most striking of all the red forms yet seen. The blooms have true thrum eyes, orange centres, and the margin is not so much fringed as finely lacinated, whilst all over the edges of the petals are seen minute white specks. An exact duplicate of this kind in form and markings has a very delicate ground of rosy mauve. Both have good habit and are robust, blooming as freely as the best kinds. The crimson kind will make a fine variety for the hybridist. A very curious sport has just presented itself on a plant of the purple kind here—one bloom, and that one only having a centre of white paste exactly like that seen in the alpine Auricula. It was pure and thick and altogether dissimilar from the centres of any other flowers. I have self-fertilised it in the hope that it may seed and perhaps perpetuate a paste-eyed strain. Had the whole of the blooms shown this feature it would have made a noise amongst the quidnuncs, who would have pronounced it the result of a cross with the Auricula. I have from time to time, however, tried crosses with various hardy species of Primula upon the Chinese Primrose but have never been successful, neither do I think that any one else has yet obtained results from the intermixture of species so widely distinct. *A. D.*

**Iron Rafters.**—I, for one, am much obliged to Mr. Baines for his interesting accounts of London market gardens, market plants, plant houses, and boilers. In his paper of the 21st ult. he speaks of the iron bars forming the rafters of Mr. Beckwith's houses being 1½ inch breadth, but does not say if they are simply flat, or made of T-iron. I presume the rafters must be the ordinary T angle-iron. Would he please say? I am struck with the simplicity of structure, and I am sure others would be glad of the same information. *P. P., Dublin.* [The bars in Messrs. Beckwith's houses are not of the ordinary T-pattern, but sash-bar iron, the shape of which is shown in the accompanying transverse section. The material used is the best Low Moor iron, rolled in Scotland to Messrs. Beckwith's pattern. They receive them in bundles, like ordinary rod-iron, of the length they require. Messrs. Beckwith point to the necessity of the bars being perfectly free from twist, otherwise, when bent as required, they would not range true for the glass. T-iron would not answer, as Messrs. Beckwith have it without purlines, ridge-pieces, or anything to strengthen the roofs, the dispensing with which admits more light, and saves cost. As will be easily seen, a given substance of iron standing edgeway, as Messrs. Beckwith use it, is very much stronger than the strength if T-shaped. *T. Baines.*]

**The Frost and the Apricots.**—The late severe frosts have been cruel to our Apricot trees, and on some of the varieties they have proved deadly. The varieties thus done for beyond hope are the Peach Apricot, the Turkey Apricot, and the Roman Apricot. The Moor Park and Breda, especially the Moor Park, are comparatively uninjured. Fortunately, more than two-thirds of our trees belong to these varieties, and we have good hopes yet of their well-doing. Were I planting any number to-morrow, I would never plant any other kind but the Moor Park, for it has proved here the most prolific and the hardiest of any of the above varieties. *Henry Knight, Floors.*

**Abies bifida.**—I long ago came to the same conclusion to which you have arrived in regard to A. firma and bifida. I enclose a few leaves, all taken from the same plant in my garden. The short spatulate ones from the upper branches have already nearly, or in one or two cases quite, lost the bifid character. The new growth at the end of the lower branches still retains the bifid character of the young plants. This plant, like the other Japanese Conifers, is perfectly hardy here, but in habit it is one of the most undesirable of all trees, the branches being short and early deciduous, giving it a weak miserable appearance. This is true of all the specimens I have ever seen. *S., Boston, U.S.*

**Sea Sand.**—When I inform you that I exhibited at the Chiswick shows in the late Dr. Lindley's time you will perceive I am not very youthful. Seeing your remarks on Mr. Cannell's experiments in striking cuttings in sea-sand, and having for many years used it largely, not only for striking cuttings but mixed freely with soil for almost all kinds of plants, I can strongly recommend it, also for a dressing over the flower-beds and borders after they have been dug up in the autumn. It causes the earth to work easily in the spring, and has a good effect in giving vigour to seeds sown or plants put out, and further it keeps the ground moist in dry weather. I have often wondered that farmers and horticulturists

do not use it more than they do. I will give you a strong case: A workman at the harbour here saw a quantity of refuse loam shot on a waste near the sands; he, having some idea of garden work, at once set-to at odd times and dug into it a large quantity of the sand. He then planted some Cabbage plants, which grew wonderfully fine, with dark green leaves, with large hearts, which quite surprised him. In the spring he planted a few Vegetable Marrows and some French Beans, both of which also grew freely and bore abundantly; this he repeated for three years, and frequently boasted of his garden and the great produce he got from it, attributing the success mainly to the sea-sand. *William B. Miller, Elms, Rams-gate, March 2.*

**Chrysanthemum frutescens Etoile d'Or.**—Seeing by your issue of February 21, p. 242, that there has been, and perhaps may still be some misconception as to the origin of Chrysanthemum frutescens Etoile d'Or, perhaps you will allow me as a duty, and in respect to a departed friend, to say that it was raised in or about the year 1874 by Nicholas Desgeorges, deceased, the then gardener to M. Adam, also deceased, of Villa des Bruyères, Golfe Juan, près Cannes, and was from seed gathered from Chrysanthemum frutescens var. Comtesse de Chambord, known in the locality as "Anthemis à grandes fleurs," and is no doubt a cross between it and the yellow variety mentioned, which were growing together at the same time, and was I think disposed of by the widow of the said gardener to M. Nabonnaud, horticulteur, Golfe Juan, and by him named, but not until it had found its way into one or two private gardens of the neighbourhood. *S. E. F.*

**Uprooting of Conifers.**—Notwithstanding what your correspondent says at p. 246 in favour of earthing-up trees 2 feet with soil, I still maintain that it is in every respect wrong. It is quite contrary to Nature, for every tree properly planted forms a base or collar, and as it advances in years and loses the lower branches this base gives to the tree a much more pleasing appearance. Who ever saw a tower, monument, or column without a base? and when Smeaton chose the Oak tree for his model of the Eddystone lighthouse, it was not an earthed-up stem, but a fine tree, with a magnificent bole and base, as Nature ordained it. If the locality is dry and the subsoil gravelly one can easily apply the mowings of the grass around to mutch the young tree till it fairly lays hold of the soil. Besides, earthing up the stems of trees often does kill them, as I saw in the west of London last week. Parson's Green was ordered to be raised 2 feet, which was done, and the result is that, with three exceptions, the trees are all dead or dying. Again, if earthing-up the stems of trees is not injurious, why is it that those in charge of our public parks invariably place dry bricks or stones around the collar to protect it when they have occasion to raise the soil around it? A young Willow tree may, and a Grape Vine in some instances also might be earthed-up with impunity, and they will throw out fresh roots and revel in the new soil; but to earth-up the stem of any Coniferous plant is neither wise nor in good taste, and in saying this I feel sure that ninety-nine out of every hundred of the arboriculturists of this country will agree with me. *J. Rust, Eridge Castle.*

**The Surface-Dressing of Conifers and Other Trees.**—I have much pleasure in confirming the statements of Messrs. Rust and Cox on this subject. Of course it must not be overdone, though in regard to the latter a good deal of misunderstanding prevails. Most trees, and Conifers more than others, resent the heaping up of soil against their boles; that, however, may generally be avoided. Moreover, that is the worst possible place to top-dress—few or no roots will be found there. Top-dressings are most effective from a yard to 6 feet from the boles; they are easily given if the trees are properly planted and treated from the first. The chief beauty and crowning perfection of Conifers is to have their lower boughs sweep the turf. Trained thus the top-dressing is well nigh invisible. In other cases the green carpet under Conifers often becomes far too dense for their well-being. It is not perhaps so much that the grass roots exhaust the soil, as that the compactness of the masses of grass and fibres together shut out the air. The grass, too, is unnatural. Fir needles or leaves constantly destroy the grass, and they form without doubt the best possible covering, and perhaps food for the roots of the trees. They decompose slowly, and form a mould that seems very congenial to the roots. It is well in cases where no other dressings can be given to give this one of natural leaves. The needles blow about but little, and the worms speedily pull them in by one end and make them fast. I never could quite make out what the earth-worms wanted with the leaves of Conifers. One would have thought the turps could hardly prove very tempting food for them; neither does it appear certain that they eat them. Are they ventilators for

worm-casts or nests, or decoys to balk the birds? But this is wandering from the main subject, which was to confirm the immense advantage of top-dressing Conifers by several striking examples that have come under my own observation. Top-dressings, ranging from 6 to 18 inches, have been used with the best results. It need hardly be added that the latter thickness was the result of necessity rather than choice. Ground at different times and places has had to be levelled and raised so much to please the eye, and by keeping the boles clear the trees have in every case benefited by the heavy dressing. From 4 to 6 inches, however, is sufficient at one time, and in the case of rapid growing trees once every six years is by no means too frequent for a top-dressing. Bricks, stones, or masses of wood over roots have also had beneficial effects. But the action of these is probably mostly mechanical. They likewise conserve the strength of the earth and the moisture it contains. How far, then, mere weight acts as a stimulus to the growing force of the roots, and, as it were, draws them to the surface, is a difficult problem. That the roots rise more freely under such conditions is certain. Can this arise from the fact that life everywhere is at war with the inertia of death, and that the roots resent and endeavour to throw up and off the dead pressure of brickbats and stones? There are other advantages in thus weighting the roots with dead matter totally unfit for food. These root-loads prevent trees

to tight tying and the past bad season than to injury caused by the wires. Had I not been so thoroughly convinced in the cases plainly to be traced to the wires, and the wires only, which have occurred to the trees here, I should not have taken the proceedings which I did. I can at the present time show any one who may feel interested in the subject several cases of injury resulting from the galvanised wire. Some shoots are entirely killed for about 2 inches in length where they cross the wire, and that too where they do not touch the wire at all (a case of this I send with this paper to the Editors). Only a few days back Mr. Roberts, my neighbour of Gunnersbury Park, was inspecting the cases I have mentioned, and so thoroughly convinced is he of the evil results of using galvanised wire, that when recently making some important alterations he used copper wire only, and some galvanised wire which had been previously fixed he contemplates taking out and replacing with copper. The walls here were wired early in the season of 1876, before I took charge in the following summer. At the winter pruning we found quantities of shoots killed where coming in contact with or intersecting the wires. This has occurred more or less every season, this year more than usual. The wires here are fixed 14 inch from the wall and 6 inches apart, and strained horizontally. Had I superintended the fixing I would have had them as close to the wall as

he brings forward no proof that they do from an ordinary galvanised one, and as the latter is so much superior in appearance and a saving of labour and expense after it is up, it is on this that people wish for information: but there is this satisfactory thing about it, no one can be far wrong in using the galvanised wire, as the paint, if required, can always be added, whereas if common wire be used it must be painted to prevent rust. If galvanised wire were inimical, we should I think have discovered it here, as we have it indoors and out; and in both instances it has been in use some ten or twelve years, but although this is the case we never find a shoot affected except through pressure caused by tight tying, and the wood is green enough this winter to have suffered, if frost has anything to do with it—for here the thermometer fell to within 4 of zero, and yet the worst trees we have are those that are nailed, the joints of the bricks there being broken and damp. *J. S.*

— If those who contemplate wiring their Peach walls have decided to have the joints pointed at the same time, they need, for their own and their employer's interest, to look very sharply after those whom they employ to do the work, or the consequences may be of such a nature as will take a year or two to rectify. As a caution to others, I will briefly state what occurred here last year. It was decided to have two of the Peach walls wired and also pointed, men from a neighbouring building

FIG. 56.—A VILLAGE LECTURE, FROM THE LIFE. (SEE P. 304.)

from being blown over by the wind. The latter is seldom high enough to snap over the trunks of trees, but using the top as a leverage it upheaves the roots with their covering soil *en masse*, and thus throws the trees over. By sufficiently weighting the roots either with soil or other heavy matters the wind-power would be vanquished by inert dead weight over the roots, and the trees would thus be enabled to withstand the fiercest gales. *D. T. Fish.*

**A Hardy Broccoli.**—The gardener at Blackadder, Berwickshire, Mr. Reid, at which place 23° below zero was registered this winter, told me to-day that, notwithstanding this severity of cold, he had a fine lot of Broccoli, which had stood entire without injury. On asking the name of the variety he said it was Russian or Miller's Dwarf, a kind that he got from Dicksons & Co., of Edinburgh. In seasons such as we have had of late, varieties of hardy vegetables cannot be too well known. I rather envy Mr. Reid, for two-thirds of mine are gone had though covered with snow, like his, and I had 13° of frost less than he. *Henry Knight, Floors, Feb. 28.*

**Peach Twigs and Galvanised Wire.**—Allow me to correct an error in the article on the above subject in the *Gardeners' Chronicle* of the 21st ult. The Peach shoots which I laid before the Scientific Committee on the 10th ult. were taken from trees outdoors from a west wall. "J. S." seems by his article to infer that the injury is more likely to be attributed

possible, to prevent a current of air behind the trees. I have no doubt the system adopted by "J. S.," and described in the *Gardeners' Chronicle*, vol. xl., p. 52, is far preferable. If I had occasion to fix any wirework myself, I would certainly adopt his plan, but nevertheless I would still adhere to the old but sound system of nailing, which, when properly and carefully done, will not materially injure the walls for many years. It is better in my opinion for the walls to be partially disfigured than to have the trees, for which the walls were built, injured, and eventually killed in many cases. Of the two evils choose the less, and this in my experience is on the side of nailing when carefully done. It would be instructive to know the chemical constituents used in the process of galvanising, and also if there is more than one process, so that some galvanised wires may be more injurious than others. I am about to paint the wires here, and another season I will, if spared, give the result. In conclusion, I would state we have used the utmost caution in tying each season, so that the soil, on which "J. S." so much relies for the injury caused, will not avail in the case of the trees here. *J. Hudson.* [The specimen sent bears out all the statements of our correspondent. We shall revert to the subject on another occasion. *EDS.*]

— The remarks made by "D. C. P." relating to the above only go to show Peach trees do not suffer from canker or become injured by contact with a painted wire trellis—a fact known long ago; and

firm being employed to do the latter portion of the work. Before they commenced the trees were all unnailed and carefully tied up; a peremptory order was given and several times repeated whilst the work was proceeding to be very careful over the trees, and not to bruise or knock off any of the buds; but irrespective of all that was said, the trees were bruised and hacked about in a frightful manner. Having other important work on hand at the time it was impossible to be with the men so much as one could have wished. The full extent of the injury done was only seen when the trees began to grow, then it showed itself to an alarming degree, gum exuding from all bruised places, shoots of the previous year dying back, some to half their length, others more. I now for my own part feel half inclined to forego all pointing in the future, unless the walls are in such a state as to render it absolutely necessary, and prefer to battle with whatever insects loose joints may harbour rather than have a repetition of such mutilation. Where it is possible I would strongly advise the employing of one or two of the estate bricklayers for work of this description; they will, I venture to say, be found much more careful than these *gild* an hour gentlemen. *J. Horsfield, Heytesbury.*

**The Winter and the Wall Trees.**—It is almost too early as yet to write of the full effects of the winter on the fruit trees on walls. The winter may not yet be over by any means, and the full effects of severe frost do not become apparent in a few weeks. It is

also possible that the apparent effects of this winter's frosts will be worse than the real injury inflicted. The frost bit the trees while their leaves were yet green. It froze them through and fixed them on. The withered leaves shrivelled as if fire had at once scorched and impaled them—gave the trees a ghastly, wrecked, death-like appearance. Some of the greener wood shared a fate similar to that of the leaves, and has been severely bruised and discoloured. This bruising of unripe wood by frost is a singular phenomenon, which has been but little noticed, and seems rather difficult of explanation. The branches have all the appearance of the cold having hit them a violent blow, or as if they had been held vice-like in the cold crushing grip of the frost. Anyhow, the life of such branches is already as good as gone. Like wounded animals, they make a few convulsive efforts and then the struggle for life ends, and Death claims them for its own. This mode of putting it suggests another curious feature of frost-bitten trees, that is, the precocious haste with which they burst into flower and leaf. They seem the first to challenge the rude blasts of our cutting springs, as if they were so uncertain of their strength as to be impatient to put it to the test. The over-haste to grow of wounded and diseased trees is one of the mysteries of growth with which the cultivator would do wisely to reckon this season. It seems probably a result of weakness, which moralists assure us is ever in a hurry, while strength can afford to wait. Be that as it may, all protective expedients should at once be got ready, for the open weather of the past few weeks has already started the sap in Peaches, Nectarines, and Apricots on walls; and should the frost hit the wounded trees hard after the sap is in motion our last hope of a crop of fruit or the recovery of the trees would vanish. Even those who deprecate protection in ordinary seasons would be wise to use it this season, as the trees are no doubt more tender than usual, and consequently more liable to injury. The last year, unfavourable as it was to horticulture, suggested one fruit-cultural lesson of considerable importance; that was, that Peaches and Nectarines, especially in the Eastern Counties, enjoy a wet season. Seldom have trees so severely crippled in May recovered so rapidly or made such good growths as last year. Had the wood only ripened better or the frosts been less severe the crop would have been good. If, as our meteorological prophets affirm, and the small rainfall of the last four months seems to forbode, we are likely to have a dry summer, it will be well in all our waterings not to forget our Peaches and Nectarines on walls. They may enjoy their warm quarters at top while their roots are well fed and abundantly watered, but with their heads semi-roasted on hot bricks and their roots also hot and dry, it can surprise no one to find weakness, mildew, red-spider and other maladies, which in their cumulative effects are often almost as injurious and destructive as the frost itself. *D. T. Fish.*

**Memoranda of Apricot Flowering.**—The following is a copy of dates extracted from my note-book of the first expanded flower of Apricot blossom in the open air, on trees growing against a south wall in the gardens, Gordon Castle, as showing the earliness or lateness of the period for the last twenty-eight years:—

Year.	Month.	Year.	Month.
1853 ..	February 28	1867 ..	February 21
1854 ..	March 2	1868 ..	March 2
1855 ..	" 8	1869 ..	February 12
1856 ..	" 1	1870 ..	March 9†
1857 ..	" 1	1871 ..	" 3
1858 ..	February 25	1872 ..	February 20
1859 ..	" 22‡	1873 ..	March 2
1860 ..	March 9	1874 ..	February 6§
1861 ..	February 24	1875 ..	March 7
1862 ..	" 28	1876 ..	February 25
1863 ..	" 24	1877 ..	March 3
1864 ..	March 2	1878 ..	February 23
1865 ..	" 15	1879 ..	March 10
1866 ..	February 23	1880 ..	February 20

It will be seen that the earliest year was 1874 (February 6), and the latest 1865 (March 15), and the number of years on which flowers were open in February was fourteen, or exactly one-half. *J. Webster, Gordon Castle.*

**The Mazagan Bean.**—In addition to the reference to this well-known garden Bean made on p. 167, it appears to be pretty certain it is a Bean of very ancient date, that it has been known in this country from time immemorial, and is supposed to have been introduced by the Romans. The Mazagan Bean, though classed among the earliest of their type—indeed the Mazagan is always described as the earliest in seed lists—is yet a little later than the Longpod, the Seville Early Longpod, and the Dwarf

Fan. An enterprising farmer in Buckinghamshire has discarded the old type of Horsebean, and grows the Mazagan for cattle food in preference, and finds that it gives a much better return—as much as 8 quarters, or 64 bushels, per acre, the seed being also of greater weight. In regard to the origin of the green forms of the Windsor and Longpod Beans, a M. Delaunay, writing in *Le Bon Jardinier*, some fifty or sixty years ago, described the green Beans as "a new sort cultivated about Paris, called the green Bean of China." It was regarded as a good Bean, late, but productive; and it had the peculiarity possessed by the green Beans of the present day, that the seeds remain green even after being ripe and dried. Those who cultivate these green Beans for culinary purposes assert that they are of excellent quality for table, but probably the prejudice against their colour interferes somewhat with their more general growth in gardens. *R. D.*

## Notices of Books.

**European Ferns.** By James Britten, F.L.S. With coloured illustrations from Nature by D. Blair, F.L.S. London: Cassell, Petter, Galpin & Co.

Of this somewhat expensive book, on a still popular subject, the first six parts are before us. It is of quarto size, and when completed will form a handsome volume. We do not, however, find in the parts issued any intimation as to the extent to which the work is proposed to be carried: the parts which have as yet been published deal only with a very small fragment of the subject.

The work presents three special features. There is first an introduction, giving a general description of the structure of Ferns, their classification, geographical distribution, and culture. Then come the descriptive notices of the European Ferns, of which portraits are given. Thirdly, there are the portraits themselves, which, as a circular note issued with the last part states, "specially characterise" the work.

The introduction is avowedly brief and a mere sketch of the subject, and possibly may not extend much beyond the portions already issued. Be this as it may, the author has given a very pleasantly written and intelligible explanation of the nature and character of Ferns as distinguished from other branches of the vegetable kingdom. This portion of the text will be very useful to those who need the information, as no doubt will be the case with a considerable proportion of the purchasers of a popular picture-book of this class.

Of the descriptive portion of the text we can only speak from the fragment before us. The arrangement adopted seems to be that of Hooker's *Species Filicum*; not, however, strictly so, for *Athyrium* and *Ceterach* are admitted into the table of genera, while Hooker merges them both in *Asplenium*. In the same table there is mentioned a genus *Aspidium* (which must be meant to include the modern *Polystichum* and *Lastrea*), while in the introduction two of our native *Lastreas* are referred to as *Nephrodium Filix-mas* and *Nephrodium Thelypteris*—a discrepancy which is suggestive of a halting between two opinions on the matter of nomenclature. The descriptions of the genera and species are carefully, and, so far as we have noted them, accurately written, in a popular and readable form, the usual style of attaching to each species treated on a specific character and technical description, with an array of synonyms, where they exist, being avoided; hence we conclude the book is intended as a popular rather than a scientific memoir on the Ferns of Europe. The distribution of each species gives material for an interesting paragraph, while, instead of a generic character, a note of some of the chief peculiarities presented by different species of the genus, whether European or extra-European, is given. All this Mr. Britten has worked out conscientiously and well. We note some old acquaintances amongst the woodcuts introduced, but which would have been quite as well omitted, in the shape of blocks that have done previous service in Dr. Deakin's *Florigraphia Britannica*.

The conception of the coloured plates is, we think, a mistake, in so far as they represent reduced figures of the plants portrayed. A reduced figure as a woodcut is seldom misunderstood, and if accompanied by a coloured plate in which portions of the plant are shown of the natural size, a very good idea of the plant is obtained. A reduced coloured figure is a

totally different affair, and let it be ever so carefully labelled as being half or one-third natural size, an uninformed person will never realise the difference between the picture and the reality. Thus we may venture to say that no one would recognise the plate (by-the-bye the plates are not numbered) which professes to be a portrait of the well-known Hare's-foot Fern, and which happens to be labelled "one-third natural size," as that of *Davallia canariensis*, nor could any one possibly recognise the plant by means of the plate, the figure being far more suggestive of the very different *Davallia bullata*. In such a well-marked plant as *Struthiopteris germanica* (here called *Onoclea*) the objection is not of equal force, the habit being in this species unmistakable. In the plates of *Woodsia* and *Cystopteris*, where the figures are of the natural size, Mr. Blair has been much more successful; but in the representation of these genera, as of the others also, we should like to have seen more analytical figures introduced, especially clearly drawn enlarged figures of the fructification. The plate of *Adiantum* again, in part vi., is weak and ineffective, from the attempt to show two large tufts on the page. Still, on the whole, Mr. Blair has done his share of the work satisfactorily, so far, at least, as his special art is concerned.

We have thus distinctly indicated what we conceive to be the weak points in this volume in order that, as many more have to follow, an opportunity may be afforded to rectify them in the future. Though the book was not perhaps much wanted, it is not without use, inasmuch as it brings into one view a set of Ferns never before similarly associated; and taking it as whole, it is certainly a creditable production—creditable to the publishers for the tasteful manner in which it is brought out—to the artist for the fidelity of his figures, it being to the plan, not the execution of the plates, which we object—and to the author for the careful and comprehensive manner in which he has treated the subject from its many points of view, though we do not fall in with his notions of classification.

## The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 3, 1880.

MONTH AND DAY.	BAROMETER.		TEMPERATURE OF THE AIR.				Hygrometrical Deductions from Glaisher's Tables 6th Edition.	WIND.	RAINFALL.

Feb. 26.—Fine till 3 P.M., then dull till 7 P.M. Cloudless afterwards. Windy. Slight shower at 8 A.M.  
 — 27.—A fine day, partially cloudy. Windy. Little rain before 9 A.M.; slight hail at 11 P.M.  
 — 28.—Generally fine, though dull at times. Rain in early morning. Cloudless at night.  
 — 29.—A fine day, dull and cloudy at intervals. Rather windy. Overcast at night.  
 March 1.—A fine day, partially cloudy. Windy. Smart showers between 7 and 8 A.M., and 4 and 5 P.M.  
 — 2.—Generally fine till evening, then overcast. Little rain at night. A gale of wind.  
 — 3.—A fine day, generally cloudy. Strong wind. Heavy rain in early morning. Few drops of rain at night.

LONDON: *Barometer.*—During the week ending Saturday, February 28, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.80 inches at the beginning of the week to 30.47 inches by the morning of the 25th;

\* Ripe, July 26. † Ripe, July 29.  
 ‡ Ripe, end of July; all over by August 25; heat great, and excessively dry.  
 § Ripe, July 22.

decreased to 29.52 inches by the morning of the 28th, and increased to 29.66 inches by the end of the week. The mean reading for the week at sea level was 29.98 inches, being 0.56 inch above that of the preceding week, and 0.02 inch below the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 51° on the 28th to 49° on the 24th; the mean value for the week was 46°. The lowest temperatures of the air observed by night varied from 28½° on the 25th to 40° on the 28th; the mean value for the week was 34½°. The mean daily range of temperature in the week was 11½°, the greatest range in the day being 20½° on the 25th, and the least 5½°, on the 24th.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Feb. 22, 38°.8, —0°.3; 23d, 39°.5, —2°.7; 24th, 37°.3, —2; 25th, 38°, —1°.5; 26th, 43°.2, +3°.5; 27th, 40°.5, +0°.0; 28th, 45°.9, +5°.8. The mean temperature of the air for the week was 40°, being 0°.5 above the average of observations extending over a period of sixty years.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 98½° on the 25th, 93° on the 22d, and 92° on the 26th; on the 23d and 24th the reading did not rise above 48°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 26° on the 25th, 29° on the 22d, and 29½° on the 23d. The mean of the seven lowest readings was 30½°.

**Wind.**—The direction of the wind was W.S.W., N., and N.N.E., and its strength strong. The weather was dull and wet during the first three days of the week, but fine and bright afterwards. Hail fell on the 22d, and fog and mist prevailed on the same day.

Rain fell on three days, the amount measured was 0.35 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, February 28, the highest temperatures of the air observed by day were above 53° at Truro, Plymouth, Cambridge, and Sunderland, and below 49° at Bristol, Bradford, and Leeds; the mean value from all stations was 51½°. The lowest temperatures of the air observed by night were below 29½° at Truro, Blackheath (London), Wolverhampton, and Nottingham, and above 34° at Liverpool, Leeds, and Sunderland; the general mean from all places was 31½°. The extreme range of temperature in the week was above 24° at Truro and Cambridge, and below 15° at Liverpool and Leeds; the mean range from all stations was 20°.

The mean of the seven high day temperatures was above 48° at Truro, Plymouth, and Sunderland, and below 45½° at Wolverhampton, Bradford, and Leeds; the mean value from all places was 46½°. The mean of the seven low night temperatures was below 35° at Blackheath, Wolverhampton, Nottingham, and Hull, and above 37° at Truro, Leeds, and Sunderland; the mean from all stations was 35½°.

The mean daily range of temperature in the week was above 13° at Truro, Plymouth, and Hull, and below 9° at Liverpool, Bradford, Leeds, and Sunderland; the mean daily range of temperature from all places was 10¾°.

The mean temperature of the air for the week from all stations was 40¾°, being 5½° higher than the value for the corresponding week in 1879. The mean temperature was above 42° at Truro, Plymouth, and Sunderland, and below 40° at Wolverhampton, Nottingham, and Hull.

**Rain.**—The amounts of rain measured during the week varied from 0.44 inch at Bristol and 0.37 inch at Sheffield, to 0.08 inch at Nottingham and 0.06 inch at Brighton; the average fall over the country was a quarter of an inch.

The weather during the week was generally fine and mild, though cloudy with slight showers at times.

Fog prevailed at Cambridge on February 22.

**SCOTLAND: Temperature.**—During the week ending Saturday, February 28, the highest temperatures of the air observed by day varied from 56° at Paisley and 54½° at Aberdeen, to 47½° at Greenock; the mean value from all places was 50½°. The lowest temperatures of the air observed by night varied from 30½° at Aberdeen to 35½° at Glasgow; the mean from all stations was 33½°. The mean range of temperature from all places was 17¼°.

The mean temperature of the air for the week from all stations was 42½°, being 7½° higher than the value for the corresponding week in 1879. The mean temperature was above 43° at Glasgow and Leith, and below 41½° at Greenock and Perth.

**Rain.**—The heaviest fall of rain was 1.38 inch at Greenock, and the least fall was 0.10 inch at Dundee; the average fall over the country was 0.41 inch.

**DUBLIN.**—The highest temperature of the air was 52°, the lowest 33°, the extreme range 19°, the mean for the week 43°; and the amount of rain 0.12 inch.

JAMES GLAISHER, F.R.S.

Obituary.

By cable-message intelligence has been received of the death, at Melbourne, at the end of last week, of Mr. WILLIAM DUNNETT, eldest son of Mr. W. H. Dunnett, of Stour House, Dedham, a partner in the firm of Messrs. James Carter, Dunnett, & Beale. Mr. William Dunnett had been in delicate health for some time past, and by the advice of his medical attendant he went out to Melbourne in October last, the firm having one of their elaborate stands at the Melbourne Exhibition. The change, from which so much was hoped by his friends, failed to bring about an improvement in his health, and he died at the early age of thirty-two. His wife accompanied him on the journey, and was with him to the last. Mr. William Dunnett was brought up to take an active interest in the seed-growing establishments at Dedham and St. Osyth, and about eight years since he came to London to take the post of manager of the wholesale department at the Holborn house, under Mr. Beale. He was a thorough man of business, with a clear and penetrating insight and judgment, but physical weakness, endured with great patience under trying circumstances for many years, prevented that energetic action he would otherwise have displayed. As it was, he was most active in the discharge of responsible duties, and they were performed in a way that won for him the respect and esteem of all. In the home family circle, where filial and fraternal affection were ever present in its pleasanter form, his loss will be keenly felt.

— We much regret to announce the death of Mr. THOMAS PARKER, of St. Michael's Hill and Stapleton Nurseries, Bristol. Not only in his own parish, where he was churchwarden, but all through the old city and neighbourhood his genial, pleasant temper and straightforward business habits combined to make him a most agreeable companion and to win for himself the respect of all whose good fortune it was to know him intimately. His industry and integrity have long been acknowledged by his many patrons and friends, and we sincerely hope that the success in life he thereby attained will be the good fortune of his two sons, who now succeed him in the business. Mr. Parker died on February 27, at the age of 59.

Enquiries.

He that questioneth much shall learn much.—Bacon.

**LEEDS RHUBARB.**—The quotations of "Leeds" Rhubarb in your market reports tempts me to ask if any of your Yorkshire correspondents can give any information with reference to the production of the large supplies of forced Rhubarb which every season comes into the London markets from the locality named. I have been told that some of the exhausted mines in Cornwall are now used for forcing Rhubarb for market purposes. Any information on that point would also be appreciated. Q.

Answers to Correspondents.

**BOOKS: Gn. Tagore, Calcutta.** André's *L'Art des Jardins* has not been translated into English.

**CAULIFLOWER LEAVES: R. P. H.** The leaves have been badly affected by the thrips, probably in consequence of having been kept in heat too long after the seeds had germinated.

**CINERARIAS: Old Subscriber.** A showy strain, useful for home decoration, large and high-coloured, but in many cases too rough on the surface to take a very high position.

**CONIGEROUS SELDS: Subscriber.** If of choice kinds, sow in pans of loamy soil and place them in a cold frame; in this case do not bury them too deeply. If they are of commoner sorts, they may be sown in well-prepared beds in the open ground.

**GREVILLEA ROBUSTA: Amateur.** A greenhouse plant. Sow in heat.

**HURRY'S WEED EXTRACTOR: Daisy.** We understand that Mr. Hurry has experienced some difficulty in getting his invention properly manufactured, but is now in a position to supply it. Pampesford, Cambridgeshire, is the inventor's address.

**INSECTS: J. E. D.** The insect which is devouring your friend's Vines is the weevil (*Otiorhynchus sulcatus*), which shams death when disturbed, and is easily captured. Spread a sheet under the Vines at night, tap the canes smartly, and the pests will fall into it.—*W. G.* The very minute white insects found in the soil of your garden are the common *Podura terrestris nivea* of De Geer (*Lipura ambulans*, Lubbock). Although found in great numbers, we do not think they are destructive to healthy plants—they are generally found in decaying vegetable matter. The *small brown thing* is the chrysalis of some two-winged fly

belonging to the family Muscidae, which it is quite impossible to determine in this state. A wash formed of sulphur, lime, and soot is beneficial to plants. *L. O. H.*

**MATRICA INODORA FLORIFLORA: H.** It is to be sent out in May by Messrs. Dicksons & Co., Waterloo Place, Edinburgh.

**MENHSA PELEGRUM GIBBERIARUM: G. H. H.** (p. 279). You will find the following an expeditious way to get up a large stock:—Spread about 4 inches of light soil—leaf-mould, or cocoa-fibre, and sandy loam—over the bottom of an ordinary cold frame; press it down firmly with a spade, and then prick in the cuttings, 1 inch apart, water with a fine-rose pot, and keep the lights closed, and, if sunny, shade. In a week all will be rooted and growing, and in a fortnight other cuttings may be taken from them, for the smallest but strikes root as freely as the largest. *H. Widdsmith.*

**MUSHROOMS: A Foreman.** The manure for making up the beds is usually spread out and turned in the way you describe, and is afterwards thrown together into a heap, so as to get nicely warm before taking it into the house. The beds made of this material, and properly spawned and earthed over, seldom fail to yield good crops. In the other case the cause of failure seems to have been the raw state of the manure employed, which probably, when worked up into the bed, became over-heated.

**NAMES OF FRUIT: J. E.** 1, Beurré Rance; 2, decayed beyond recognition.

**NAMES OF PLANTS: E. H. Scpell.** *Chrysanthemum frutescens*, var. *Etoile d'Or*.—*Bob.* 1, *Andromeda anillans*; 2, *Herniaria glabra*; 3, *Kleinia repens*.—*A. H.* *Sparmannia africana*.—*H. A. C.* 1, *Coccoloba platycladon*; 2, *Adiantum caudatum*, var.; 3, not found; 4, *Columna hirsuta*; 5, *Justicia flavicomis* (calycotricha); 6, *Centrostemma reflexum*.—*E. C. H.* Six at one time is the limit. 1, *Phlebotium aureum*; 2, *Cyrtomium falcatum*; 3, *Pteris crenata*; 4, *P. longifolia*; 5, *Asplenium lanceolatum*; 6, *Pteris cretica*. The others next week.—*H. Freeman.* *Cologyne flaccida*.—*Quercit.* The Fern is probably *Polypodium neriofolium*, but you sent no fructification. The Orchid is *Cattleya labiata*.

**PHYLLOXERA AT THE CAPE: R. Johnson.** See our numbers for February 14 and 21, pp. 203, 249.

**RAFFIA: R. W.** It is manufactured from the leaves of a Palm, *Sagus* or *Raphia ruffia*, a native of Madagascar. See our number for April 13, 1878, p. 470.

**STOPPING VINES: Walter Johnstone.** We prefer leaving one joint at first, and as close as may be necessary after, so as to leave room for proper leaf development.

**VINES: Walter Johnstone.** The precise influence of particular stocks for Vines is not yet clearly ascertained. We should prefer the Alicante in both cases.

**CATALOGUES RECEIVED:—James Carter & Co.** (High Holborn, W.C.), Catalogue of Farm Seeds.—Edward Webb & Sons (Wordsley, Stourbridge), Catalogue of Farm Seeds.—Fredrick Bax (143, Bishopsgate Street Without, E.C.), Catalogue of Vegetable, Flower, and Agricultural Seeds.

**COMMUNICATIONS RECEIVED:—O. C.—Mr. S.—A. M.—J. C. B.—K. W.—W. A. C.—C. H.—G. H. P.—W. B. H.—J. S.—D. T. F.—E. B.—J. C.—R. D.—T. B.—W. H.—J. A.—R. J.—G. Syme.—C. S. S.—H. N. M.—P. E.—M. P. W.—L. M.—C. E. C.**

**DIED,** on the 23d ult., at Melbourne, WILLIAM HENRY, eldest son of W. H. Dunnett, Esq., Stour House, Dedham, Essex, aged 32. Friends will please accept this (the only) intimation. (*By Cable.*)

Markets.

COVENT GARDEN, March 4.

We have been very quiet here all the week, even imported goods falling off considerably. Outdoor vegetables are easier, and forced stuff is in better supply. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: *March 3*—There is now more doing in firm seeds, and the prevalent tone is less depressed. The unlooked-for Continental demand for new and yearling American Clover, which has recently been experienced, has made an appreciable inroad upon stocks; the Liverpool market in particular being considerably relieved thereby. A large fire in Chicago has just consumed 3000 bags of Clover seed, and 17,000 bags of Timothy. Alsike and Trefoil are quiet. In white there has been more business passing. Grasses about maintain late rates. For Lures there is an increasing request, and the tendency of values favours the seller. The Canary seed trade shows some slight improvement. Hemp seed is now remarkably cheap. Lentils and Haricots are also very moderate. In feeding Linseed there is no quotable variation. *John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.*

CORN.

Trade was dull at Mark Lane on Monday, and quotations were not so well supported as last week. No change was reported in Wheat, but millers operated very cautiously, and the tendency was certainly in favour of the consumer. Barley was slow of sale, and prices were unaltered. Malt was quiet. For Oats rates moved somewhat in favour of buyers; this applies also to Maize. Beans, and Peas were steady, without much inquiry; and flour was dull, rates in some instances being a trifle easier.—The tone of trade on Wednesday was rather dull. As regards Wheat the supplies fresh up were only limited, and holders were not anxious to press the market. Oats, Maize, Barley, and other classes of produce were also not in very good supply; but the demand was very poor, and where there was any change it was on the side of the buyer. Flour was very dull.—Average prices of corn for the week ending Feb. 28:—Wheat, 43s.; Barley, 35s. 2d.; Oats, 22s. 3d. For the corresponding period last year:—Wheat, 38s.; Barley, 33s. 10d.; Oats, 19s. 7d.

HAY.

Tuesday's Whitechapel Market report states that supplies were limited, but the trade being dull quotations were not very well supported. Prime Clover, 100s. to 128s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 95s.; inferior, 50s. to 70s.; and straw, 30s. to 36s. per load.—On Thursday there was a very short supply on sale. The trade was good, and prices were as follows:—Prime Clover, 100s. to 127s.; inferior, 60s. to 90s.; prime meadow hay, 80s. to 96s.; inferior, 30s. to 70s.; and straw, 30s. to 38s. per load.—Cumberland Market quotations:—Superior meadow hay, 98s. to 105s.; inferior, 40s. to 78s.; superior Clover, 118s. to 124s.; inferior, 80s. to 98s.; and straw, 36s. to 40s. per load.

POTATOS.

From the Borough and Spitalfields Markets reports we learn that good Potatos have been in fair demand, and the markets present a steady appearance. Scotch Regents, 110s. to 100s.; Champions, 160s. to 180s.; Lincoln, 190s. to 180s.; Victorias, 160s. to 180s. per ton. German reds, 6s. 6d. to 8s.; Dutch whites, 5s. 6d. per bag.—The imports into London last week comprised 109,278 bags from Hamburg, 1001 Bremen, 1010 St. Nazaire, 7170 Harlingen, 2125 Rotterdam, and 867 bags and 609 sacks from Boulogne.

**Government Stock.**—The closing price on Monday for Consols for delivery was 97½ to 97½, and for the account 97½ to 98. On Tuesday business closed at 97½ to 97½ for delivery, and 97½ to 98 for the account; the same prices were recorded on Wednesday. On Thursday the closing price for delivery was 97½ to 97½, and for the account, 97½ to 98.

Lawn Mowers — Lawn Mowers.

THE GREAT SUPERIORITY OF GREEN'S PATENT "SILENS MESSOR" AND "MONARCH" LAWN MOWER

Over those of all other Markers is universally acknowledged. They will Cut Either Short or Long Grass, Bents, &c., Wet or Dry. These advantages no other Lawn Mowers possess. They have been in constant use for upwards of twenty years in

- The Royal Gardens, Windsor,  
 Buckingham Palace Gardens, The Hyde Park Gardens  
 Marlborough House Gardens, Hampton Court Gardens  
 Royal Horticultural Society's Gardens, The Zoological Gardens, Regent's Park  
 The Royal Botanic Gardens, The Dublin Botanic Gardens  
 The Crystal Palace Company's Gardens, The Liverpool Botanic Gardens  
 The Winter Palace Gardens, The Botanic Gardens, Brussels  
 The Bull Botanic Gardens, The Leeds Horticultural Gardens

And in most of the Principal Parks and Squares in the United Kingdom.

They are the simplest in construction, the easiest to work the least liable to get out of order, make little noise when in use, and are the most durable Lawn Mowers extant. The above machines have proved to be the best, and have carried off Every Prize in all cases of Competition. Every Lawn Mower is guaranteed to give entire satisfaction, otherwise it may be returned at once, free of cost to the purchaser. The largest stock of Mowers kept in London, and including all sizes from 6 inches to 48 inches, is to be seen at our London establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, and have their orders executed the same day they are received.

**GISHURST COMPOUND**—

Used by many of the leading Gardeners since 1850, against Red Spider, Mildew, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 ounces to the gallon of soft water, and of from 4 to 16 ounces as a winter dressing for Vines and Fruit Trees. Has outlived many preparations intended to supersede it. Sold Retail by Seedsmen in Boxes, 1s., 3s., and 10s. 6d. Wholesale by PRICE'S PATENT CANDLE COMPANY (Limited).

ESTABLISHED 1839.

**POTATO DISEASE—POTATO DISEASE.**

**GYDE'S AMAZONAS SANA COPIA, or DISEASE-RESISTING POTATO MANURE.**

The very best Manure ever manufactured for the Potato. See *Farm Journal*, February 17, 1880.

"Dear Sir,—We have tried the Amazonas Sana Copia Potato Manure supplied by you, and have much pleasure in stating that the produce of Potatoes was three times the quantity to those grown with the aid of stable manure. The tubers are much larger in size, of fine quality, and little affected by disease.—Yours faithfully,  
"To Mr. Trinder."  
"BANTIN BROTHERS."

For prices and particulars apply to W. TRINDER, Manager, Stroud Chemical Manure Works, Stroud, Gloucestershire.

**ORCHID BASKETS** (great reduction in).

Patterns and Prices sent post-free on application. **MAW AND CO.**, Benthall Works, Broseley, Shropshire.

**Hurry's Daisy and Weed Extractor,**

FOR LAWN.

No one possessing a Lawn should be without this wonderfully useful little invention.

The following particulars, from the *Gardeners' Chronicle* of August 2, 1879, will at once show the value of this useful, and comparatively costless, little invention, which can be used by ladies or children:—

"How to Extract Weeds from Lawns.—A short time since, when at Pampesford, we had an opportunity of seeing used and of using a gouge, which was very effectual in removing Plantains and similar weeds from lawns. By a slight twisting movement the gouge was inserted over the crown of the plant, which was quickly extracted. The soil, removed as cheese would be by a cheese-taster, is readily re-inserted in the hole, a little fresh soil being added, if need be, to keep up the level. By the use of this instrument a lad was enabled to clear a lawn very rapidly. It is the invention of **Mr. ALFRED F. O'C. HURRY**, of Pampesford, who has registered it."

Another great advantage of this tool is that the plugs of earth extracted can be re-inserted upside down, which not only fills up the hole, but destroys the weed effectually; the plugs discharge themselves, the second pushing out the first, and so on.

To be obtained of all Ironmongers and Florists. Price 3s. 9d. only. In Polished Wood, fancy handle, 4s. 6d.

Wholesale Agent: **THOMAS TILLEY**, 12, Walbrook, London, E.C. Cambridge Agents: **G. BEALES & CO.**

King's Road, Chelsea,

London, S.W.

**CUPISS'S CONSTITUTION BALLS.**

This justly celebrated Medicine for more than 30 years has proved to be the best and cheapest for

**HORSES AND NEAT CATTLE,** Cheaper because required to be given only once a week, and not every second or third day,

**PRESERVING HEALTH, VIGOUR AND CONDITION.**

Their cost, too, is saved by the food turning to a better account, for it is a fact that Horses will keep up their condition better upon three feeds of Oats daily when a Ball is occasionally given than with four feeds without the Balls.

**REARERS OF NEAT CATTLE**

Will find the Balls most valuable, not only in case of disease, but in Rearing Young Stock, they will Grow to a Larger Size, come to Perfection Sooner, and to a Greater Weight with the same quantity of food if a Dose (see directions) of the Balls is given occasionally.

Prepared by the Proprietor,

**FRANCIS CUISS, M.R.V.C.S., DISS, NORFOLK.**

Author of the PRIZE ESSAY on the "Diseases of the Liver of the Horse."

Sold by all Chemists, in Packets at 1s. 9d. and 3s. 6d. each; or 7 large Packets for 21s., or 7 small for 10s. 6d.

Gentlemen using the Balls may consult the Proprietor gratuitously.

**MAKENZIE AND MONCUR,**

Horticultural Builders and Heating Engineers,

UPPER GROVE PLACE, EDINBURGH, AND 43, ST. ANDREW'S CROSS, GLASGOW.

**MAKENZIE & MONCUR**, from long practical experience in Horticultural Building in all its branches, and having extensive Works, with the newest and most approved Steam-power Machinery, are in a position to execute all orders entrusted to them with efficiency and despatch, on the most moderate terms. They use nothing but the very best materials in Iron, Timber, Glass, Paints, &c., and have always a large staff of sober, experienced workmen in the various departments.

Hothouses of every description contracted for in any part of the United Kingdom.

**M. & M.** have made Heating with Hot Water a special study, and are prepared to contract for Apparatus either on the ordinary low-pressure principle with Cast-iron Pipes and Malleable-iron Boilers, or on the high-pressure principle with Malleable Tubes and Fire Coils, and will guarantee satisfactory results in all cases.

Splendid **ILLUSTRATED CATALOGUES**, with more than Eighty Designs, 3s. 6d. in Postage Stamps.

Special Plans and Specifications supplied on receipt of particulars, and Gentlemen waited upon when required.

Lights only—glazed, 16s. each; unglazed, 5s. each. Orders amounting to 40s. carriage paid.

**JONES'S PATENT "DOUBLE L" SADDLE BOILER.**

These Boilers possess all the advantages of the old Saddle Boiler, with the following improvements—viz., the water-space at back and over top of saddle increase the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes:—

Sizes.			To heat of 4-in. Pipe.	Price.
High.	Wide.	Long.	Feet.	£ s. d.
20 in.	18 in.	18 in.	300	7 0 0
20 "	18 "	24 "	400	8 0 0
20 "	18 "	30 "	500	9 0 0
24 "	24 "	24 "	700	12 0 0
24 "	24 "	30 "	850	14 0 0
24 "	24 "	36 "	1000	16 0 0
24 "	24 "	48 "	1400	20 0 0
28 "	28 "	60 "	1800	25 0 0

Larger sizes if required.  
From Mr. CHARLES YOUNG, Nurseries, Batham Hill, S.W., May 29, 1873.  
"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn the refuse of other tubular boilers I have in work."

PRICE LISTS of HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES for HOT-WATER APPARATUS, erected complete, will be sent on application.

**BULLETIN d'ARBOICULTURE,** de FLORICULTURE, et de CULTURE MARAICHERE. A monthly horticultural work, with superb Coloured Plates and Illustrations. Published since 1865 by F. BURVENICH, F. PAYSNAERT, E. RODIGAS, and H. J. VAN HULLE, Professors at the Horticultural School of the Belgian Government at Ghent. Post-paid, 10s. per annum.  
H. J. VAN HULLE, Botanical Gardens, Ghent, Belgium.

Two Gold Medals awarded to us by Royal Horticultural Society, at the

Grand Show at Preston, July, 1878, out of Fourteen Competitors.

Having extensive works, special machinery, and first-class workmen, who have been many years in the trade, we are able to supply the very best class of buildings at an extremely low price. As we are the only firm in the kingdom that has ever been awarded *Two Gold Medals* by the Royal Horticultural Society, this will be some proof of the quality of our productions.

Our buildings are constructed so as to combine great strength, simplicity, and durability, with extreme lightness, and being made of the very best materials, will, with ordinary care, last a lifetime. The ventilators at top and bottom open the whole length with one handle to each series. The glass used is 21-oz. British sheet, and the put is the best genuine white lead and oil.

HEATING APPARATUS, with thoroughly reliable Boilers supplied and fixed in the most practical and efficient manner, and guaranteed to work economically and answer its purpose in all seasons. We devote special personal attention to this branch of our business, and have never had a failure.

Plans, Estimates, and Catalogues free. Customers waited on in any part of the Kingdom.

R. HALLIDAY & CO., Royal Horticultural Works, MIDDLETON, MANCHESTER.

## IMPORTANT NOTICE.

Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

**WANTED, IMMEDIATELY,** in the country, a GARDENER, to Grow Cucumbers, Cut Flowers, &c., for Market.—State wages required, and references, to JOHN GOODLIFF, George Hotel, Huntingdon.

**WANTED,** an experienced GARDENER, to attend to a Kitchen and Flower Garden, two small Vineries, Conservatory, and Plant-house. Good wages will be given.—Mr. HINSON, Oxton, Birkenhead.

**WANTED,** a good SINGLE-HANDED GARDENER. Good character. Must thoroughly understand Hothouse Plants and Laying-out Beds, &c.—Apply to Capt. FIFE, Sherborne, Dorset, stating when at liberty, how long in last place, cause of leaving and to whom to refer for character. No house or extras. Wages 24s. per week.

**WANTED,** a thoroughly good UNDER GARDENER, sober and of good character.—J. ALLEN, The Gardens, Norton Hall, Sheffield.

**WANTED,** a steady, industrious MAN for the Kitchen Garden; not under twenty-four years of age. Wages 10s. per week.—Apply, giving references, to THOMAS TAYLOR, The Gardens, Duncannon, Oatlands Park, Surrey.

**WANTED,** a respectable, steady, industrious young man, as THIRD, in the Houses.—Apply, with full particulars, experience, and references, to Mr. HUMPHREY, The Gardens, Nash Court, Faversham, Kent.

**WANTED,** a young man, as ASSISTANT BUDDER and GRAFIER.—One acquainted with Herbaceous Plants preferred.—Apply, by letter, giving references, age, and wages expected, to D. S. THOMSON, The Nurseries, Wimbledon.

**WANTED,** TWO respectable Young MEN in the Houses, under the Foreman. Must understand Tying Pelargoniums, &c. From a Nursery where Soft-wooded Stuff is grown for Covent Garden preferred.—JAMES WALTON, Hornpark Nursery, Eltham Road, Lee, S.E.

**WANTED,** a Young MAN, who has worked in a London Nursery and assisted in the Packing.—For further particulars apply at R. GREEN'S Bedford Conservatories, Covent Garden Market, W.C.

**WANTED,** a Young MAN used to Market-work under Glass. Must be a good waterer of plants, quick at putting, and a good stoker; to take the lead under the Head Gardener, where Orchids, Cucumbers, and Strawberries, &c., are extensively grown. Also an IMPROVER. Both found.—Apply personally to the HEAD GARDENER, Manor Farm, North Cray, Kent.

**WANTED, AT ONCE,** a married Man (age 30 to 40), as WORKING GROUND FOREMAN.—He must be thoroughly practical, experienced in the Propagation and Management of Conifers, Roses, Fruit Trees, &c.—State full particulars with references and wages, to LE TALL AND DAVIES, Handsworth, Woodhouse, Sheffield.

**WANTED,** TWO smart, active Young MEN, accustomed to the Management of Stove and Greenhouse Plants in Nurseries. None need apply whose characters will not bear strict investigation.—Apply, stating experience, with references, and wages expected with both, to IRELAND AND THOMSON, Craighleith Nursery, Comely Bank, Edinburgh.

**WANTED,** a MAN and his WIFE, without family, to live in a Lodge—man's age 30 to 35. He must be capable of Pruning Hardy Fruit Trees, Mowing Short Grass, and taking an active part in the management of the crops in a first-class Kitchen Garden. His wife will have to attend to the gate. An energetic, healthy couple, whose characters will bear the strictest investigation, will find this a permanent and comfortable situation.—For particulars and terms, apply to W. COLEMAN, Eastnor Castle, Ledbury.

**WANTED,** two good JOBBING HANDS.—Must be steady, and well up to their work. Wages, 22s. per week, with option of overtime during summer.—Apply, BOURNE AND UNDERWOOD, Florists, &c., 52, High Street, Camden Town, N.W.

**WANTED,** an experienced SHOPMAN.—Salary to commence at the rate of £80 per annum.—Address B. BARR & SUGDEN, 12, King Street, Covent Garden, W.C.

**WANTED,** a BOOK-KEEPER; must be well acquainted with the Nursery and Seed Business, and a correct Accountant. Unexceptional references required for sobriety and honesty. Applicants to state full particulars as regards experience, age, and wages expected to FISHER, SON, AND SIBRAV, Handsworth Nursery, Sheffield.

**WANTED,** in the office of a London Firm of Horticultural Builders and Hot-water Engineers, a Gentleman to take the Management of the Office.—Must be a good Draughtsman (including Perspective), quick at Accounts, and good and rapid writer. One with a previous experience in Horticultural Engineering preferred.—Address, stating age and salary required, XXL, *Gardeners' Chronicle* Office, W.C.

## WANT PLACES.

**IMPORTANT NOTICE.**—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES at Post-offices, as Letters so addressed are not taken in, but are sent at once to the Returned Letter Office.

**JOHN COWAN,** The Vineyard and Nurseries, Garston, is at present in a position to recommend a Scotch GARDENER for a large establishment, whose character and abilities may be thoroughly depended upon.

**DOWNIE AND LAIRD** can at present recommend with every confidence several first-rate SCOTCH GARDENERS, whose character and abilities may be thoroughly depended upon, either for Large Establishments or Single-handed Situations; also FOREMEN, UNDER GARDENERS, and FARM BAILIFFS.—17, Frederick Street, Edinburgh.

**GARDENER (HEAD).**—Thorough practical experience in Fruit, Flower, and Orchid Cultivation, and can produce most satisfactory references both from late and former employers.—J. J. WALTON, Higham Hill, Walthamstow.

**GARDENER (HEAD),** where one or more are kept.—Age 29; understands Vines, Cucumbers, Melons, Stove and Greenhouse Plants, and Flower and Kitchen Gardening. Good character.—C., 2, Alfred Cottages, George Street, Sutton, Surrey.

**GARDENER (HEAD).**—Age 34, married, no family; twenty years' practical experience, five with last employer. Good reference. No Single-handed place accepted.—R. F. PENFOLD, 6, Adelaide Terrace, Thames Ditton.

**GARDENER (HEAD);** age 36, married.—Mr. VEITCH can with confidence highly recommend a thorough practical Man with good character—one who is well known as a first-class Fruit Grower, &c.—New North Road Nursery, Exeter.

**GARDENER (HEAD),** in a good place.—Age 34; thoroughly practical in Early and Late Forcing of all kinds of Fruit, Flowers, and Vegetables, and in the management of men. Excellent references.—D. L., Mr. Davis, Bullbrook, Bracknell, Berkshire.

**GARDENER (HEAD),** to any Lady or Gentleman requiring the services of a thorough practical energetic Man.—Age 35, married; has had twenty years' experience in all branches of the profession.—Four and a half years' excellent character from present situation.—Please state wages, &c.—H. PESTRIDGE, Shireoaks, Worksop.

**GARDENER (HEAD),** to any Nobleman or Gentleman requiring the services of a thoroughly practical man.—Middle-aged, married; twenty-one years' experience. Thirteen years' character from last situation. Southern Counties preferred.—GARDENER, Mr. Earnard, 49, Fleet Street, London, E.C.

**GARDENER (HEAD),** to any Nobleman or Gentleman requiring the services of a thorough practical man.—Age 32, married, no family; well experienced in all branches of the profession, Land and Stock. Good character. Wife can Manage Poultry if required.—GARDENER, Hyde, Stationer, New Malden, Surrey.

**GARDENER (HEAD).**—Age 35, married; most highly recommended by his recent employer for ability, sobriety, and integrity, throughout his whole term of service of upwards of nine years. A thorough good Gardener, having studied the profession completely, and under the best gardeners in England.—NICOL, 49, Thorngate Road, St. Peter's Park, London, W.

**GARDENER (HEAD).**—Age 34, married, one child; Protestant.—THOMAS WOODFIELD desires to obtain a situation as above; accustomed to large Gardens. Thoroughly competent to make or manage a good Garden. Four years Head Gardener to Colonel Wright, Watcombe Park, Torquay, previously principal Foreman with Mr. Gilbert, Burghley, Stamford, who will be glad to answer any inquiries.—T. WOODFIELD, Post-office, Painswick, Stroud.

**GARDENER (HEAD).**—Age 36; first-class. Excellent Fruit and Plant Grower. Thoroughly practical, and a successful exhibitor. Nine years' good character.—GARDENER, 44, Girdlestone Road, Upper Holloway, N.

**GARDENER (HEAD).**—Age 32; thoroughly experienced in all branches of the profession. Well up in Carpet Bedding. Sixteen years' experience.—M. W., 1, Gritton Road, Tottenham, London.

**GARDENER (HEAD),** where two or three are kept.—Age 40; understands all general routine of Gardening. Total Abstainer. Three years' good character. Leaving (through death of employer).—GARDENER, 95, St. James Street, Brighton, Sussex.

**GARDENER (HEAD),** to any Lady or Gentleman requiring a thoroughly practical energetic Man.—Age 29; fourteen years' experience in all branches of the profession. Highest testimonials. Please state wages.—W., 5, Hanover Street, Leicester.

**GARDENER (HEAD).**—A LADY wishes to recommend her Head Gardener, who is leaving for no fault. She will give him an excellent character. He is unmarried. Has lived with her five years, and before that was Foreman at Alton Towers. He has had five under him, a cottage, and £50.—Apply, Lady N., 35, Eaton Place, W.

**GARDENER (HEAD, or good SINGLE-HANDED).**—Age 26; twelve years' experience in all departments in good establishments. Good references.—A. SKEGGS, Hun-don, Ware, Herts.

**GARDENER (HEAD).**—Age 37, married; thoroughly acquainted with Early and Late Forcing of Fruit, Flowers, and Vegetables, also Kitchen and Flower Gardening, with Land and Stock if required. Three and a-half years' unexceptional character.—R. S., Pixholme Lane, Dorking, Surrey.

**GARDENER (HEAD),** where two or three are kept.—Age 28, married; seventeen years' experience. Thoroughly understands Forcing, Kitchen Gardening, and Pleasure Grounds.—E. COOPER, 11 Holland House, Crouch Hill, Hornsey, N.

**GARDENER (HEAD, WORKING),** where two or more are kept.—Age 27, single until suited. Twelve years' practical experience in all branches of the profession. Good references.—Apply, stating particulars, to C. CANDLER, the Gardens, Crowe Hall, Bath.

**GARDENER (HEAD, WORKING),** where two or more are kept.—Age 26, single; twelve years' practical experience in some of the leading Gardens. At present Foreman.—THOS. SMITH, The Rookery, Fromley Common, Kent.

**GARDENER (HEAD, WORKING).**—Age 38, married, no family; thorough practical in all branches. Eighteen years' experience. Understands Land and Stock. Four and a half years' good character, twelve years' previous.—M. J., Chase Gate, Wadley Common, Barnet, Herts.

**GARDENER (HEAD, WORKING),** where more are kept.—Married, no family; many years' good practical experience in all branches. Now disengaged. Good character.—R. WALKLING, 7, Gardnor Road, Hampstead, London, N.W.

**GARDENER (HEAD).**—Age 32, married, two children; thoroughly understands his duties. Excellent character.—WILLIAM GURMAN, Spinfield Gardens, Great Marlow, Bucks.

**GARDENER (HEAD, WORKING)**, where one or two others are kept.—Married. Good Single-handed place not objected to. References good.—**HEAD GARDENER**, Sudbury Lodge, Sudbury, Middlesex.

**GARDENER (HEAD, WORKING)**.—Age 26, single till suited; eleven years' experience. Two and a half years' good character.—**X. Y.**, Mr. Russell, Chipstead, Surrey.

**GARDENER (HEAD, WORKING)**, where two or more are kept.—Age 40, married, family from home; thoroughly practical in all branches. Ten years' good character.—**J. S.**, Hill House, Morden, Mitcham, Surrey.

**GARDENER (HEAD, WORKING)**.—Many years' practical experience in all branches of gardening, both in England and Scotland. Six years in present situation. Satisfactory reasons for leaving.—**MACDOUGALL**, St. Michael's, Bognor, Sussex.

Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.**  
Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—29, Great Titchfield Street, London, W.

**EPPS'S COCOA.**  
**GRATEFUL AND COMFORTING.**  
"By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—*Civil Service Gazette.*  
**JAMES EPPS and CO., HOMOEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s. 6d., 4s. 6d., and 11s.—13r, Fleet Street, E.C.

**DINNEFORD'S MAGNESIA.**  
The Medical Profession for over Forty years have approved of this pure solution as the Best Remedy for  
**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
**HOLLOWAY'S PILLS and OINTMENT.**  
—The great variations of temperature, the fogs and the foul vapours which permeate the atmosphere, try the respiratory channels terribly; hence arise Hoarseness, Quinsies, Loss of Voice, Bronchitis, and the whole train, and endless variety of Throat and Chest Affections which now prevail. Neglect of these in their early stages is almost criminal, as many a life might be saved through early and prompt treatment by means of Holloway's well known remedies. This treatment can be readily and easily carried out, and soon disposes of the attack in a most satisfactory manner, by restoring the balance between the circulation and respiration, by lessening the inflammation, abating the febrile symptoms, and by soothing the irritability of the nerves.

**TREES for AVENUE, PARK, or STREET PLANTING.**

ACER DASYCARPUM, 14 to 16 feet, girding 5 to 7 inches.  
 CHESTNUT, Horse, 12 to 14 feet, girding 5 to 7 inches.  
 " Horse, 14 to 16 feet, girding 8 to 10 inches.  
 " Horse, Scarlet, 10 to 14 feet, girding 6 to 8 inches.  
 LIMES, 14, 15, 16, 18, and 20 feet, girding 6 to 10 inches.  
 PLANES, Occidental, 10 to 12 feet, girding 4 to 5 inches.  
 " Occidental, 12 to 14 feet, girding 5 to 6 inches.  
 A few hundred splendid PLANES, 16 to 18 feet, girding 8 to 10 inches.  
 POPULUS CANADENSIS NOVA, 12 to 14 feet, girding 6 inches.  
 MAPLES, Norway, 12 to 16 feet.  
 BEECH, Purple, 10 to 12 feet.  
 OAKS, Scarlet, 10 to 12 feet.  
 CHESTNUTS, Spanish, 10 to 12 feet.  
 SYCAMORE, 12 to 15 feet.

They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe.  
 The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive.  
 ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

**MAGNUM BONUM POTATOS. — A**

splendid sample of the above, grown from Seed, direct from the raiser (Mr. Clarke), price 7s. 6d. per bushel of 56 lb., free on rail, sacks included.  
 Also about 10,000 strong HAZEL, at 15s. per 1000.  
 H. T. BATH, Seedsman, &c., 80, High Street, Lymington.

**LEICESTER RED CELERY has again**

proved itself to be the hardiest, sweetest, most solid, and best Celery this unfavourable season; when most kinds have been soft and watery this has been good in every way. Those wishing to obtain the true article should have it in printed packets, price 1s.; post-free on receipt of 13 stamps  
 BROCCOLI, Harrison's new Dwarf Hardy: a late valuable kind, 1s. per packet.  
 SAVOY, Harrison's King Coffee Garden, 1s. per packet.  
 TURNIP, Harrison's Exhibition; a perfect round white variety, from 6d. per packet.  
 CARROT, Harrison's Early Market, 6d. per packet.

**HARRISON'S "LEICESTER SEEDS," of**

choicest quality, are supplied in collections of 21s. and upwards, sent carriage free. Trade Prices and full particulars on application to  
 HARRISON AND SONS, Seed Growers, Leicester.

ROOTED CUTTINGS (Choice Varieties with Names).

FREE AND SAFE BY POST. FREE AND SAFE BY POST.

We have much pleasure in offering the following in well-rooted healthy young plants, and which, by our improved system of packing, can now be sent by post with perfect safety to any part of the British Isles. Customers may depend on really fine varieties only being sent, but the selection must in all instances be left to us:—

Table with columns for plant name, description, and price per dozen. Includes Begonia fuchsoides, Chrysanthemums, Coleus, Dahlias, Fuchsias, Geraniums, Mimulus, and Pentstemons.

From CAPTAIN JAS. DE COURCY HUGHES, Rathdowney, Queen's County, October 24.

"I enclose Post-office Order to amount of account, and am much pleased with the rooted cuttings I got from you. They all turned out well, and made particularly nice shaped plants."

From ROBERT BOULT, Esq., Halvergate, July 5.

"I have the pleasure of informing you that the collection of Pelargoniums sent by you to Holland last Autumn, to Mr. V. W. de Villeneuve, was awarded the Gold Medal at the Horticultural Show held this week at Nymegen, Holland."

Cheques or Post-office Orders to

TOWN CLOSE NURSERIES, NORWICH.

Early Orders solicited by

JEAN NUYTENS-VERSCHAFFELT, GHENT, BELGIUM

NEW AMERICAN POTATOS.

The following varieties have been carefully tested in various parts of this country as well as in Europe, and have met with the unqualified approval of all who have given them a trial. For exhibition purposes they are unrivalled, and have already secured many prizes:—

- 1. PRIDE OF AMERICA.—In appearance resembles the Snowflake, a few days later; very productive, large size, an excellent keeper; of superior quality. 2. MATCHLESS.—Tubers very handsome, round, pale red; flesh fine grained, pure white, and of excellent quality. A great cropper, an excellent keeper. 3. SILVERSKIN.—A cross between the Early Rose and White Peach Blow. Tubers medium to large. Skin smooth, silvery white, russeted. Flesh snowy white, fine grain, splendid quality; an excellent keeper.

One pound of either of the above varieties will be mailed post-paid to any address in Europe, upon receipt of 45., or its equivalent in English currency.

Remittances can be made in Post-office Stamps or Postal Money Order on New York or London, payable to B. K. BLISS AND SON.

The above varieties can also be obtained of Messrs. HOOPER AND CO., Covent Garden, W.C.; of CARTER, DUNNETT, AND BAILE, London, W.C.; of D. BRINKWORTH AND SONS, Reading; KERR AND FOTHERINGHAM, Dumfries, Scotland.

BLISS' ILLUSTRATED POTATO CATALOGUE contains a descriptive list of all the new varieties recently introduced, with many other desirable sorts, beautifully illustrated. Centennial Collection of 500 varieties. Also much useful information upon the cultivation of this valuable e-culent. Mailed post-paid to applicants enclosing six penny stamps.

All of the older standard varieties, sound and healthy stock, supplied in any quantity at market prices.

ADDRESS.

**THOMAS METHVEN & SONS**

ARE NOW SENDING OUT THE VERY DESIRABLE

**NEW APPLE, "NORTHERN DUMPLING."**

This large Culinary Apple, for which a Cultural Certificate was awarded by the Royal Horticultural Society of London in 1874, was raised from seed some years ago by Mr. J. Webster, Gordon Castle Gardens, as far north in latitude as 57° 38'. It is a cross between "White Moor" and "Stirling Castle," being much larger than either sort, and of a very different form; stalk, much sunk, short and fleshy; eye, hollow

and slightly ribbed round the apex; shape, roundish oblong; colour, yellowish-green, with a rosy tint next the sun.

The "Northern Dumpling" has proved to be both hardy and prolific—much desired qualities in a British climate—combining the excellencies of the well-known old favourites with a constitution admirably adapting it for cultivation in cold and exposed districts.

*A Coloured Lithograph of the Apple will be sent to every Purchaser of Six Trees.*

Price, 7s. 6d. each. The usual Discount to the Trade.

LEITH WALK NURSERIES, EDINBURGH.

**ODONTOGLOSSUM ALEXANDRÆ, EX SS. "MEDWAY."**

MR. J. C. STEVENS has received instructions from The New Plant and Bulb Company of Colchester to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY, March 15, at half-past 12 o'Clock precisely, a magnificent consignment of ODONTOGLOSSUM ALEXANDRÆ, from the BEST LOCALITY near Bogota. The plants of this consignment are large in size, varying from five to twenty-five bulbs in each mass. The bulbs are of enormous size. This consignment is believed to be the finest ever received. Also upwards of 1000 CATTLEYA MENDELII, ODONTOGLOSSUM PESCATOREI, O. BLANDUM, O. TRIUMPHANS, &c. Also the rare CATTLEYA AUREA.

*May be viewed the morning of Sale, and Catalogues had.*

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

TO THE TRADE.

**SEED POTATOS.**

**H. & F. SHARPE**

Invites the attention of the Trade to their Special PRICED LIST of SEED POTATOS, issued last November,

Which comprises, amongst many others, the following excellent varieties, viz. :—

PRIDE OF ONTARIO (New),  
 RIVERS' ROYAL ASHLEAF,  
 MYATT'S PROLIFIC ASHLEAF,  
 MONARCH KIDNEY (New),  
 AMERICAN EARLY ROSE,  
 BRESEE'S PROLIFIC,

MAGNUM BONUM,  
 CHAMPION,  
 ELLIOTT'S WONDER,  
 SNOWFLAKE,  
 BRESEE'S PEERLESS,  
 BRESEE'S KING OF THE EARLIES.

The above have been Grown from the Finest Selected Stocks, are of Splendid Quality, and Free from Disease.

SEED GROWING ESTABLISHMENT,  
 WISBECH.

The **Lawson Seed & Nursery Company, Ltd.**  
 Seed Growers and Merchants

ALSO  
 NURSERYMEN FOR FOREST, ORNAMENTAL, AND FRUIT TREES,  
 SHRUBS, AND ALL KINDS OF HOUSE PLANTS.

**THE SCOTTISH CHAMPION POTATO.**

The unprecedented demand for this favourite kind has now reduced stocks in Scotland to a very small compass. We recommend, however, fine sound seed of EARLY DALMAHOY SCOTCH REGENT, or IRISH KEMP, RED BOG, VICTORIA, and MAGNUM BONUM; prices of which, as well as of the remaining CHAMPIONS on hand, will be forwarded upon application.

*The Lawson Seed & Nursery Co. Ltd.  
 Edinburgh and London.*

1, GEORGE IV. BRIDGE, EDINBURGH, and 106, SOUTHWARK ST., LONDON, S.E.

ORCHIDS. ENORMOUS STOCK.

The largest in Europe.

MR. WILLIAM BULL has thousands of these beautiful plants to select from, at 7s. 6d. and 10s. 6d. each, and upwards.

DANIELS' SUPERB PANSIES.

Post-free. Post-free.

EVERY ONE HAVING A GARDEN should procure Seeds of the following superb varieties, which we have much pleasure in offering:—

Table listing various Pansy varieties such as 'PANSY, Show and Fancy, very fine', 'Large Blotched, magnificent strain of handsome varieties', etc., with prices per packet.

From W. MARSHALL, Esq., F.R.S., Dublin.

"My Pansies, from your seed, are and have been the admiration of all my friends and neighbours."

THE ROYAL NORFOLK SEED ESTABLISHMENT, NORWICH.

NINE CHOICE DECORATIVE COLEUS—Lord Falmouth, Geo. Bunyard, Exquisite, Fascination, Kentish Fire, Royalty, Garnet, Pictus and Multicolor. The set of nine plants, price 2s. 6d. post free, or 16s. per 100.—WILLIAM ABRAHAM, Nurseryman, Limerick.

TO BE DISPOSED OF, on account of being too large for the place, a number of SPECIMEN CAMELLIAS, in very good condition. They consist of some of the best kinds in cultivation, such as the following varieties, all true to name:—La Reine, Valtevareda, Rose la Reine, Asmode, Countess of Orkney, Fargioni, Lady Home's Blush, Cup of Beauty, Queen Victoria, Duc de Bretagne, Albo-pleno, Reine des Fleurs, and Henri Favre. Varying from 7 feet to about 15 feet high, and some of as much as 15 feet through.

Apply to THE GARDENER, Woodhouse Hall, Huddersfield, Yorkshire.

Choice Coniferæ, Evergreen Shrubs, &c.

March and April are the best months for transplanting all Evergreen and Coniferous Trees for Ornamental Planting, Coverts, or Fencing.

Mr. C. BOXALL, North Cray, Kent.

# MR. SOLOMON'S BOILERS.

At the two famous Fruit-growing Establishments, Peckham Rye, the property of Mr. Solomon, Fruiterer by appointment to Her Majesty the Queen, His Royal Highness the Prince of Wales, and other members of the Royal Family, a series of different forms of Boilers have been tried and replaced by three of our Patent Duplex Upright Tubulars, making a total of four in operation, now working both the entire establishments.

One of these Boilers had been on its trial for about ten years, thus showing that no hasty conclusions were formed as regards the adoption of the latter three, which after several years' test Mr. Solomon states, in a letter dated March 2, 1880 :—

"I can always state with confidence that all you have undertaken for me in the shape of Hot-water Work, &c., has always proved in the highest degree satisfactory and successful. After many years' experience and observation it is my decided opinion there is no Boiler extant so powerful, efficient, and economical as your Patent Duplex Upright Tubular. The one that has been working ten years, and those of a later date, continue to give my Manager and myself perfect satisfaction."

*Our NEW CATALOGUE (15th Edition) is now ready, and will be sent free, on application.*

ART IN THE CONSERVATORY.  
*(Concluded from p. 293.)*

NOT a few conservatories are decidedly unsightly for lack of a due proportion between their different parts. In not a few, for example, the base is too heavy for the top. Others stand like the baseless fabric of a vision, which the first wind might sweep over with a crash into one wreck of ruin. A visibly solid, obviously safe base should be a leading characteristic of all glasshouses designed for the safe shelter and sure growth of plants, and the enjoyment and use of men. Houses apparently all base with a glass lantern on the top are equally opposed to good taste, and are as unsightly as they are unserviceable. The solidity and weight of the foundation, the size of the ribs, the width of the rafters, should all be nicely adjusted to the character and size of the house. The proper proportions should also be preserved between size and form. This to some extent is a necessity, but it is often departed from as widely as possible in practice. It seems a mere truism to affirm that the shorter a conservatory the narrower and the lower it should be; but it is no uncommon thing to meet with small conservatories as broad as they are long, and with domes or spires shooting up into the clouds, as if destined to form resting-places for wearied skylarks, rather than glasshouses for the successful cultivation of plants. No doubt the width of houses and their angle of inclination determines their height in ordinary cases; but neither of those in general use are so assuredly the best, either for convenience or cultural purposes, as to relieve architects and builders from the necessity of reconsidering the artistic relation of width to length of house, and of height to both. It seems almost certain that were the law of due proportion of each part of glasshouses to the whole better understood, conservatories would not only be more beautiful but far more useful. Science has also far outrun Art in the matter of ventilation. Science has insisted on a change of air—gradual, constant, genial. Ventilation whips the inside air out, and lets the outside in, in the rudest and most rapid manner possible. And the machinery for effecting such changes is in perfect keeping with the work done. Roof sashes are slid down or lifted up, and front lights pushed out, slid down or pushed past each other, and if these processes can be done rapidly by a few turns of a crank or a brief grinding of cog-wheels, all parties concerned seem satisfied. Not only, however, do the ventilators and their gearing mar the artistic beauty of most conservatories, but the mode of changing the air of conservatories and other glasshouses is most wasteful of heat and of moisture, and consequently is as injurious as it is extravagant. It is high time that architects and builders turned their attention afresh to this matter, and their combined talent ought to

provide the means of removing the atmosphere in glasshouses without waste, danger, or disfigurement. The air should be warmed and moistened before admission, and admitted in sufficient quantity without turning the house itself, as well as its atmosphere, inside out. Formulas of ventilating area for conservatories of different dimensions would also prove as useful as the number of feet of hot-water pipe needed to heat any given number of cubic feet of air.

Shading may be considered as a branch of ventilation, and likewise as an aid to heating as well as cultivation. In neither of these three-fold aspects does it seem to have excited the attention of architects. Notwithstanding all that has been written about "Summer Cloud," and other materials and modes of shading, the whole matter, alike in the materials employed and the modes of using them, is in almost as rude and primitive a state as it was when a lighter style of architecture and improved glass proved shading necessary. And yet it is no uncommon thing to find elegant conservatories adjoining magnificent mansions shaded with what looks like a dirty sheet or a dilapidated rick-cloth, the incessant flappings of which destroy all sense of repose and even endanger the safety of the conservatory in windy weather. A change of place, of material, and also of modes of gearing and moving blinds, seem imperatively called for alike by taste and convenience. Were blinds placed inside instead of out, the external disfigurement incident to their use would be got rid of. Inside blinds could also be used in winter in aid of conserving the heat of the internal atmosphere from being worse than wasted by radiation into space. It is found in practice that the covering of the roof in clear frosty weather saves 50 per cent. of fuel. The rapid waste of heat by intense radiation, and the efforts thus rendered necessary to keep up the temperature, place the plants as it were between the two extremes of frost and fire, and prove most injurious to them. Surely it might also be possible in this age of mechanical invention, when indestructible hand-basins are manufactured out of shoddy, to find some better material for conservatory blinds than any of the textile and other fabrics that have yet been used. In France thin splints of wood are employed, but these are fixtures on the outside, and would be far too opaque for our sunless climate. What is needed is some semi-imperishable material, such as thin splints of wood, metal, paper, or other substance, at once durable and light, and quickly removed, adjusted, and applied by some such means as are employed for Venetian window-blinds.

In treating of Art in the Conservatory, the stowage and distribution of water demands more than a passing notice. As a rule nothing could well be more prosy, inartistic, and inconvenient than its treatment. Not seldom the whole rain-watershed of the conservatory is hurried off into the nearest drain or sewer. Where more thought has been given to the matter it is collected at the lowest point and conveyed into a tank underground, from which it has either to be pumped or dipped up when wanted. How seldom it seems to have occurred to architects or builders to store the water at higher levels, under shelves, or in the centre of the house where the water-tanks might be connected with the sides and ends of plant stages, or with an open tank for the culture of greenhouse aquatics. Occasionally it is stored under the paths, and covered over with iron gratings. It would also save much labour to store it sufficiently high so as to find its own level in the watering-pots when wanted for use. By having the water supply thus elevated the charm of running or dripping water—one of the softest, sweetest in Nature—might also be enjoyed gratis. In cases where the water supply can be com-

manded from a higher source, still bolder effects may easily be obtained by introducing the supply at the highest part of the house, and allowing it to trickle, run, or fall over rockwork clothed with Ferns, mosses, &c., till it reaches a lower tank, from which it may be drawn for use. No power nor force in Nature is so prodigal of artistic effects as water, and no one who has not tried the experiment could credit how much the tiny supply of water needful for the use of a conservatory can effect within the domain of Art before it sank to rest in the still tank of mere utility.

As to the internal arrangement of conservatories generally it would be a libel upon Art to affirm that these in any degree embodied or illustrated its principles. Art is easy, graceful, flowing, bold; these are stiff, stilted, hard, narrow. Art is here fettered and foundered among a weary monotonous repetition of paths, shelves, stages; these are mostly, too, of one regulation height, breadth, and capacity. Straight paths on either side or one down the middle are made as matters of course. Roofs and their furniture, or want of it, are almost as stereotyped as the floors, stages, shelves, and paths of the house. We hear a good deal in these changeful times of fixity of tenure, but that, if granted to the full, could never match the fixity of style, or the want of it rather, that sits like a nightmare on the internal arrangements of conservatories. Oh! that Art itself could have a week in our glasshouses, and clear most of the shelves, stages, and straight walks out of them. It is these mechanical impediments that stifle Art, and render taste in the internal arrangements of conservatories impossible. Doubtless there are exceptions up and down the country. One of the best was the noble fernery of Mr. Sam Mendel, late of Manchester.

The arrangement of the first great International Exhibition at South Kensington also showed what taste could accomplish with, in the main, rather stiff and unyielding material to work upon, viz., formal exhibition plants. But, doubtless, it will be said, we have no room for the artistic arrangement of our plants, we are so crowded up. *Cui bono?* This crowding is itself fatal to Art. It may be justified in houses for growing for sale, and perhaps the stage and shelf arrangements can hardly be bettered for market purposes; but the conservatory is the house for exhibiting all the floral treasures the place or garden commands. The house crowded from floor to roof with shelves and stages overflowing with plants is like the studio of the artist—it is full to confusion of undeveloped work. We do not expect the order and beauty of the picture-gallery or drawing-room in the artist's workshop. The conservatory is, or ought to be, the picture-gallery, where every plant should be a more or less finished masterpiece, and in which also it should be set in the best position in regard to others, to brighten or intensify its beauty. The internal mechanical arrangements of many conservatories, however, render this impossible, and hence our present appeal to architects and builders to clear the floor of useless encumbrances and to provide as far as possible undulating surfaces as the sure and certain foundation on which to arrange effective groups of plants.

The substitution of raised for sunken water-tanks, and coils or stacks of pipes for the orthodox ones running all round the house underground would greatly facilitate this inequality of ground surface. The abolition of straight paths at the back and front or down the middle of the house, and the introduction of one or more winding paths, as might be needed, would deal a deathblow to the straightness which strangles Art. The centre of the house might also be cleared or filled in at pleasure,

and by the aid of raised mounds of soil and rock or rockwork the walls at the front or back, or both, be at once clothed with Ferns or other plants. Cosy nooks and corners and commanding positions would be reserved for choice specimens, climbers, &c., either in pots or planted out. In a word, houses thus arranged afford endless scope for the display of taste—each varied and undulating bare line becomes as it were a separate school for teaching or illustrating some new phase of the art of beauty, and the rendering of its practice more simple and easy. In cases where it seems impossible at once to remove all shelves and stages a good deal may be done to hide their deformity, soften their hardness, and clothe them with refreshing verdure by using stage fronts with cork troughs for the culture of Ferns and mosses, such as those designed and used by the Messrs. J. Weeks & Co.

If, as seems probable from various signs of the times, architects are to be more consulted in regard to the conservatories of the future, it is to be hoped that they will see to it that the houses they design shall be worthy expressions of cultural taste and structural art, and also that their heating, lighting, ventilating, water-storing and distributing capacities are convenient and sufficient. Their internal arrangements should also be so skilfully managed that each plant may look its best, last its longest in beauty, and improve in health while it remains in the conservatory. *D. T. Fish.*

## AT BIARRITZ.

THOSE who promised flowers *partout* were looking a month into futurity. Along the roads at Biarritz I see only the yellow disc of Dandelions, but *Ruscus aculeatus* throws its prickly pointed leaves into many a hedge, and indeed, in some cases, seems to form one. I never saw this shrub berry before. What a grand fruit it has—so large, so scarlet, and so glossy! If the plant were amenable to pot culture, and in that condition could be made to berry freely, it would make a famous substitute for *Solanums*. *Smilax mauritanica* is very common, and seems to love the sea. It covers a rock near the Vieux Port, which from its sheltered position escapes being "deeked" each day with "drops full salt," yet must sometimes come in for a good dose of spray when the waves are heavy. But I am wrong in likening the sea at Biarritz unto Prospero's tears, it is so little salt. The tongue touching a pebble from the beach perceives only that it is damp, it would say, with fresh water, did not the eye give contrary evidence. Neither is there any smell of the sea; one might be hundred of miles inland so far as olfactory senses go. I am told this is owing to the absence of seaweed on this coast; and certainly, except some few pieces after the gale on Saturday, I have seen none about.

Driving inland, Primroses and Violets abound—Dog Violets for the most part, though some with a small flower smell sweet. These, however, may be runaways from gardens. And at St. Pée, while my companion sketched the old Basque "Maison du Chirurgien," I gathered a real British bouquet—the little blue *Veronica Speedwell*, the early fruitless *Strawberry*, *Pulmonaria officinalis*, and little red-tipped Daisies.

We went one day to Anglet, and viewed the gardens cultivated by the penitents in the convent there. The little nun who escorted us said the sale of plants and work (they embroider beautifully) made the institution self-paying, but I saw nothing which struck me as being particularly well grown.

The demand abroad is always great for foliage plants. I wish the English would imitate the laudable foreign custom of wiping daily the leaves of such things with a damp cloth: I mean, of course, when they inhabit dwelling-rooms. We have a fine pot of *Aspidistra lurida* in the *salon* here, and it is delightful to watch how refreshed it looks after the cleansing hand of the *garçon* has passed over it.

Those who wish to see what women—and women entirely unaided by men—can do in the way of gardening, should visit the convent of the Bernadines, close by Anglet. It is in a Pine wood, and the visitor is admonished by a placard at the entrance to "*Parler à voix basse*." The paths are of sand, so that no footfall breaks the stillness which should reign around the "*sœurs silencieuses*." Except when ill,

they never speak; but I was glad to hear their voices as we passed the chapel, and to be told that they may read as well as pray aloud. This, and their open-air life, must save their reason. "Mais non, mais non," emphatically said our attendant nun, in answer to our inquiry if many of them went mad. The impression on our minds was that the solitary system in English prisons had been stopped because of its bad mental effect. For certain, however, no occupation could be so calculated to prevent the mind turning inwards, and preying on itself, as that which these nuns follow.

Cut off from all the outer world—done with the hopes and fears, anxieties and satisfactions, troubles and pleasures, which make up the lights and shadows, the "warp and woof" of human life—they can find the chords which answer to these different feelings touched by the flowers they tend. And right well they do tend them. Every pot was clean, every plant healthy. The houses were chiefly given up to Pelargoniums and bedding stuff generally, and the air was scented by the smell of Violets, "not hidden in the grass," but in long very narrow frames.

I watched one silent sister as she watered, and though the expression of—or rather, indeed, her face altogether was hidden by her hood (I enclose a photograph of their appearance at work), it was easy to see by the tender way in which she dispensed refreshment, giving to each thirsty soul the exact amount of water they required, how much her heart was in what she did. There is a walk in the convent grounds bordered with fine Yuccas, but I saw no Camellias in the open air, or that Acacia (dealbata, I think) which grows here now in most gardens, and which seems to me the same as the one so common at Cannes.

I never saw trees so garlanded with Mistletoe as those near Cambo. It is a lovely little place, nestled at the foot of the mountains, about fifteen miles from Biarritz, with the beautiful river Nive running through it.

Between Bayonne and Cambo there are many grandiose villas, built by Basque colonists who have made a fortune on the Rio de la Plata and then come home. Their gardens are gay now with Deutzias and Forsythias, and lovely little bushes of Pyrus japonica. I think no one who saw it growing thus would ever fasten it against a wall. Wild flowers make the roadsides very gay, but we have found nothing rare amongst them.

Anemone nemorosa grows in quantity about Cambo, and we found Helleborus viridis and Daphne Laureola in a wood near St. Jean de Luz. A.

THE WINTER AND THE PLANTS.

THE exceptionally cold winter of 1878-9, so destructive to vegetation in many parts of England, passed over this portion of our island with comparatively little harm. The following list of plants, usually found to be more or less tender under the climate of central and northern England, but which here, with scarcely an exception, suffered little or nothing from the cold, will show how slight was the injury inflicted on vegetation in the south-east of Dorsetshire, and may be of some interest as affording a point of comparison with other cold seasons, as well as in its general bearing on the distribution of temperature and the relations of climate to vegetation in the British Isles.

It must, however, be kept in mind that in questions involving the resistance of plants to cold, there are two factors on both of which the result is dependent. There is (1) climate, and (2) the character of the soil. Here the soil is of a very light and sandy nature, with a natural growth of Heath, and supporting extensive plantations of Scotch Fir and Pinaster, which freely sow their own seeds. In such a soil no water hurtful to the vegetation can accumulate, and there is little doubt that plants growing in it will endure a temperature under which they would succumb in the stiff cold soil to the north of London.

Though some of the plants here enumerated may be fairly regarded as hardy even in the central and northern counties, where they will endure an ordinary winter without injury, it is not the less certain that they are there liable to be destroyed, or greatly injured, by winters to which in more southern counties they might be exposed with impunity.

The observations were made in my own garden at

Ardmore, where the lowest temperature during the winter of 1878-9 was registered on the night of January 11, when a minimum of 15° Fahr. was indicated. The list is nearly confined to exogenous plants with stems more or less ligneous. A few endogenous plants (Gramineæ and arborescent Liliaceæ) are also included. The whole embraces seventy-six species, exclusive of varieties, distributed under thirty natural orders.

EXOGENOUS PLANTS.

- Pinus insignis
- Abies cephalonica
- Cedrus Deodara (nia)
- Sequoia gigantea (Wellingtono-)
- Retinospora plumosa
- Cryptomeria elegans
- Cupressus macrocarpa
- „ sempervirens
- Cupressus Lawsoniana
- „ funebris
- Juniperus sinensis
- „ virginica
- Thuja japonica
- Thuja occidentalis var. aurea
- „ Lobbi
- Libocedrus decurrens
- Magnolia grandiflora | Magnolia conspicua var. Lenné
- Cistus ladaniferus | Cistus salvicifolius
- „ purpureus | „ formosus
- „ villosus (var. crispus) | „ albidus
- Hypericum patulum | Hypericum oblongifolium
- Tamarix parviflora.
- Hibiscus syriacus.
- Euonymus japonicus.
- Ceanothus azureus (var. Gloire de Versailles).
- Robinia hispida | Spartium junceum
- Cytisus albus
- Cerasus lauro-Cerasus | Cerasus lusitanica
- Rosa rugosa | Rosa bracteata (w)
- „ Banksiæ (w)
- Myrtus communis | Eugenia apiculata
- Fuchsia coccinea and varieties.
- Escallonia macrantha | Escallonia floribunda
- Aucuba japonica, ♂ and ♀ and vars. | Griselinia littoralis
- Viburnum Awafurki | Viburnum Tinus
- Arbutus Unedo [folia] | Erica codonodes
- „ Andrachne (var. photiniaz- | „ mediterranea
- Pernettya mucronata (and var. | „ vagans
- speciosa) | Menziesia polifolia
- Veronica Andersoni | Buddleia globosa
- „ Traversii
- Aloysia citriodora (w).
- Solanum jasminoides (w).
- Desfontainea spinosa.
- Jasminum officinale (w).
- Ligustrum japonicum | Osmanthus ilicifolius
- Laurus nobilis
- Daphne Cneorum | Daphne Fioniana
- Yucca gloriosa | Yucca filamentosa
- „ recurva | Cordyline australis
- Arundo Donax | Gynerium argenteum
- Bambusa Metake

Among the exogenous plants of the above list a few—indicated by the letter (w) affixed to the name—had the shelter of a wall with a south-west aspect; all the rest were fully exposed in the open border, and received no protection during the severest weather. Four among these last, namely, Hypericum oblongifolium, Ceanothus azureus, Arbutus Andrachne, and Desfontainea spinosa, had been

planted as late as the preceding autumn, and had scarcely had time to become thoroughly rooted. These were slightly injured by the frost, but completely recovered during the succeeding spring. One (Viburnum Awafurki) had been planted during the autumn of 1877. Its younger leaves were blackened, but the plant received no permanent injury, and became quite restored during the spring. Aloysia citriodora, though one of the plants protected by a wall, was slightly injured, but subsequently quite recovered. The New Zealand Veronicas (V. Andersoni, with its varieties and hybrids) were in most cases uninjured. In a few instances this plant showed the action of the frost on the more tender shoots, but not to such an extent as to interfere with complete recovery during the ensuing spring. V. Traversii suffered no injury whatever.

Among the few endogenous plants included in the list Cordyline australis is the only species injured. This was a fine plant, about 5 feet high, which had endured many successive winters without protection. It was now killed back to the ground, but during the ensuing summer it threw up new shoots, and became a healthy plant.

The instances of actual destruction which I have to record are those of two Australian species (Eucalyptus globulus and Casuarina tenuifolia), in both cases quite young plants and growing without any protection in the open border. *Geo. J. Allman, Pres. L.S., Ardmore, Parkstone, Dorset.*

THE GENUS LACHENALIA.

LACHENALIA is one of those interesting endemic genera which give so much interest to the flora of the Cape, one out of a great many of peculiar habit and well-marked botanical characteristics which are quite confined to the colony, and contain a wide range of specific types and a large number of species. It has two near allies, of which what has just been said also holds good, Drimia and Massonia. Cape Colony is, in fact, the great home of the petaloid Monocotyledons; and of the whole Liliaceæ and Iridaceæ probably not less than fifty per cent. of the species are found within its bounds, nearly all of them being plants which do not occur in any other part of the world. The nearest European allies of the Lachenalias are the Hyacinths and Muscari of the Mediterranean region. There are three or four Hyacinths at the Cape, one of which, H. candicans, the giant of the whole genus, is now getting widely spread in cultivation, but Muscari does not enter into the Cape flora at all, whilst of Lachenalia, Veltheimia, Massonia, Daubenyia, and Drimia, taken together, there are not less than seventy or eighty Cape species.

All the Lachenalias possess a bulb of the ordinary tunicated type, and with several thin brown membranous coats. Usually they have only a couple of leaves, which are contemporary with the flowers, and placed opposite to each other at the base of the flower-stalk. The leaves are usually broad, flat, and of fleshy texture, and often mottled or stained with purple towards the base. In some species there is never more than a single leaf, and in some others there are three or four, in which case they are cylindrical and multifarious, tapering gradually from the base to the tip. The scape is often curiously mottled or stained with red or purple. There is generally a large number of flowers to a stalk. They are arranged sometimes in a spike and sometimes a raceme, the bracts being always small and inconspicuous, and the upper flowers, as in Muscari, minute and sterile. The flowers vary in colour extremely through the genus, and often within the compass of a single species, various shades of red, purple, and yellow with white, being the most prevalent colours, and blue, green, and greenish-yellow less frequent. It is in the shape and arrangement of the parts of the wrapper of the individual flower that the principal distinctive characters of the genus lie. The segments of the perianth are arranged in two distinct rows, both of which are joined into the short cup at its base. The three outer are strap-shaped or oblong, and generally distinctly shorter than the three inner, and remain permanently placed edge to edge, and they have a small hunch at the tip, and are more membranous in texture than the inner row. The three inner ones are more decidedly petaloid in texture, and more or less distinctly spoon-shaped, broad and truncate at the tip, and narrowed downwards. The portion pro-

truded beyond the three outer segments spreads widely when the flower is fully expanded, so that we get on the whole a decided approximation to a distinct calyx and corolla, or, at any rate, an interesting link of transition in the series of forms that lie between a calyx and corolla of the ordinary type and the usual uniform petaloid perianth of the Liliaceae, as shown in a Hyacinth or Tulip. The six stamens have long filaments and small oblong versatile anthers, and are distinctly exerted in several of the small bell-flowered species. The style is long and slender, with a capitate stigma. The fruit is an oblong membranous capsule, with loculicidal dehiscence, each cell containing several black globose seeds about the size of a pin's head.

The number of species now known is between thirty and forty. About two-thirds of them have been in cultivation in European gardens at one time or another, and figured from living specimens, but I do not think there are more than six or eight in the country now. In my monograph of the gamophyllous Liliaceae, published in the eleventh volume of the *Journal of the Linnean Society*, I arranged the species under four groups or subgenera, as follows:—1. *Eulachenalia*, with comparatively large flowers, having a symmetrically tubular perianth three or four times as long as thick, with lax racemes and included stamens; 2. *Calanthus*, with a long ventricose perianth; 3. *Orchiops*, with a shorter but still tubular perianth two or three times as long as broad; and, 4. *Chlorisa*, with small bell-shaped or nearly bell-shaped flowers. The last is much the largest group, but the species now cultivated belong mainly to *Eulachenalia* and *Orchiops*.

Of *Eulachenalia* there are only three well-marked species, and these for decorative purposes are the finest plants of the genus. First comes *L. pendula*, marked by its more robust stature, broader leaves and flowers in which the segments of the outer row are nearly as long as those of the inner. Good figures will be found *Bot. Mag.*, t. 599; *Andr., Bot. Rep.*, t. 62; *Red. Lil.*, t. 52, and tab. 400 of Jacquin's *Icones*, which latter work contains by far the most complete series of plates of *Lachenalia* which we possess. *L. pendula* has a couple of fleshy leaves above an inch broad, a stout scape about half a foot long, and a lax raceme of from six to fifteen cylindrical flowers above an inch long, in which bright red predominates. The second species of this section, *L. rubida*, is dwarfer in stature and narrower in leaf, with outer segments about a quarter of an inch shorter than the inner three. Good figures of the typical form will be found *Bot. Mag.*, t. 993, and *Jacq. Icones*, tab. 398. It extends its range from Cape Town into Namaqualand, and there are two varieties, both figured by Jacquin, *tigrina* and *punctata*, in which the outer segments have bright red blotches or dots upon a pale ground. The commonest and oldest known of the species of this section is *L. tricolor*, of Thunberg, marked by its dwarfer stature as compared with *pendula*, and rather smaller flowers and narrower leaves, but especially by the outer segments of the perianth being scarcely more than half as long as the three inner. Of this, in addition to the type as figured *Bot. Mag.*, t. 82, there are three colour varieties—*quadricolor*, figured *Jacq. Ic.*, t. 396, and *Andr., Bot. Rep.*, t. 148, in which the outer segments are red at the base and yellowish-green upwards, and the inner bright red at the tip, with a yellow claw; *lutcola*, figured *Bot. Mag.*, t. 1704, in which both rows are lemon-yellow; and *aurea*, which has been mentioned several times lately in the *Gardeners' Chronicle*, and is figured *Florist*, 1871, p. 265; *Gard. Chron.* 1872, t. 109; and *Bot. Mag.*, t. 5992; a fine variety, with the segments of both rows bright orange or golden-yellow.

Of the second section, *Calanthus*, there is only one species. I had living specimens not long ago from Mr. Elwes, but there is no figure, and it is not a plant of any value from a horticultural point of view. Its name is *L. reflexa*, and it has two spreading lanceolate leaves, and a nearly sessile spike of three or four erect yellowish flowers.

The third section, *Orchiops*, contains nine species, only three of which, so far as I am aware, are in the country at the present time. Five out of the nine have the flowers in spikes, the others in racemes. Of the spicate sorts, *orthopetala* is readily marked by its four to five linear-subulate multifarious leaves. It is figured by Jacquin, but I never saw it alive. The three spicate kinds

which are in cultivation at present, *orchioides*, *glauca*, and *pallida*, all have dense spikes of flowers, with the outer segments distinctly shorter than the inner, which are abruptly falcate at the tip when expanded, and they have all three properly a pair of opposite lanceolate or lorate leaves, like those of the *Eulachenalia*s. The flowers of all three are white, or more or less tinted with red, or more rarely with yellow or blue. *L. orchioides*, the smallest flowered species of the three, will be found figured *Bot. Mag.*, t. 854 and 1269, and at tab. 171 of the *Refugium*: *L. pulchella* of Kunth, and *L. mutabilis*, Sweet, *Flower Garden*, series ii., t. 129, and *Lodd. Bot. Cab.*, t. 1076, are forms of this. *L. glauca*, *Jacq.*, has oblong tubular flowers about half an inch long, tipped with red or yellow. It is figured by *Hooker, Bot. Mag.*, t. 3552, and by *Andrews in the Bot. Reg.*, tab. 460, under the name of *L. sessilifolia*. In the spring of 1877 I saw a curious variety at Mr. Barr's, with a much spotted stem, blue-green sepals and blue petals. Of this section the finest species is *L. pallida*, figured by *Lindley in Bot. Reg.*, t. 1350 and 1945, and in the *Refugium*, t. 170. In this the flowers are often nearly an inch long, pure white, or the petals tinted at the tip with bright or deep red. In this, as in its two neighbours, the lower segment of the inner row is often a little longer, and more decidedly falcate than the two upper, an irregularity which suggested the subgeneric name *Orchiops*. We had a fine variety of *pallida* at Kew not long ago with bright yellow flowers, and bright green leaves a foot long. The other spicate species of the section *Orchiops* is *L. trichophylla*, Baker, marked by its solitary intensely hairy leaf. The racemose species of this section—*unifolia*, *isopetala*, *patula*, and *liliflora*—are none of them now in cultivation.

Of the final section, *Chlorisa*, there are about twenty species known, but they are all smaller-flowered plants, dwarfer and less effective for decorative purposes than the foregoing, and I do not think any of them are in the country now. The flowers are mostly racemose, and in several of the species the stamens are much longer than the perianth-segments. In several of them the leaves are cylindrical, and in one kind, *pustulata*, which I have not seen alive, they are covered all over the face with an eruption of rough dots, as in some of the *Massonias*. *J. G. Baker.*

### CONCERNING FLOWER SHOWS.—III.

WE have now arrived at the period when a new set of actors are about to appear on the scene—the men whose awards are sure not to give universal satisfaction, however capable and upright they may be. But first the disagreeable work of clearing the tents of all but officials has to be done. This task is best left in the hands of the police, who as a rule do it effectually, and not unpleasantly. They should be clearly instructed beforehand what is expected of them, and they should be assisted in their work by every one having a right to remain in the tents, being furnished with an official badge, which should be conspicuously displayed. The exhibitors are usually the last to linger, and to evade the order to move on as long as possible. But let the police be positively informed what they have to do, and the tents will soon be ready for the judges to commence their labours.

Before starting on the work of adjudication, the secretary, or some one told off for the purpose, should have pointed out to the judges any special regulation in the prize-list which they must be acquainted with in order to carry out the intentions of the framers. Each judge should be supplied with a list of the entries actually staged in the classes entrusted to him. The lieutenants in charge of the tents will receive the judges on their arrival at the scene of their several labours, and assist them in recognising the exhibits staged in competition for the first set of prizes they have to award. When the prizes have been awarded in this class the exhibits in the next should be similarly identified, and so on to the end, to prevent any exhibit being overlooked. This, of course, is only likely to occur where, for convenience, the exhibits in any one class are staged apart; but as this is constantly done to prevent unevenness in the display, the precaution is a necessary one. Of course, where possible, it is always best for the judges to have all the entries in a class staged in juxtaposition. In small exhibits this is generally

done; but in the more important classes, where a number of plants, especially large and effective ones, are in competition, they have to be disposed with a view to general effect, and this very often involves separation.

Here it may not be amiss to consider the subject of judging generally. Unfortunately we have no fixed settled canons for the guidance of judges in the adjudication of prizes, and it is no unfrequent circumstance to have for censors men who are good cultivators, and perfectly honest, but who are unskilled in the exercise of independent and logical judgment. Such men, however capable, are often influenced by prepossessions for or against, which warp their opinions, and cause their decisions to be less accurate than they ought to be—biased by a liking or disliking, which has an element of unsoundness in it. [We quite agree with our correspondent on this point, although it is rather a favourite theory with some, that good cultivators only can be good judges. It is not so; a well-trained eye and a judicial turn of mind, backed of course by a fair general knowledge of plants and plant-culture, is of more importance than the fact of the individual having grown the finest specimens ever seen. Eds.]

Moreover, another complication is often unwittingly introduced by a defective understanding of the principles underlying the terms of the schedule, and which are set forth somewhat obscurely, it may be, though well enough understood to be there by the framers. Let us consider an often-occurring instance—say the class set apart for decorative plants. We will suppose the phraseology of the prize-list to be “12 stove or greenhouse plants, in or out of bloom” [for decorative purposes], the words in brackets being omitted, but being in the minds of those framing the schedule. Whether present or absent, they would be understood as being implied by most men, I think, unless a statement to the contrary were appended. This being so, it must be obvious that the value of the collection from a decorative point of view ought to be the primary consideration set before the mental vision of the judges in coming to a conclusion how the prizes are to be distributed. It may happen that the most effective collection from this point of view may be made up of plants which are neither new, rare, nor difficult to grow, and yet they may be individually so beautiful and so excellently grown, and so artistically grouped, as to be the most decorative collection staged. Of course the first prize should go to this exhibit. And yet cases have been known where the bias of the judges in favour of novelty, or their appreciation of difficulties overcome in the cultivation of refractory plants, has caused the preference to be given to a collection decidedly less valuable as decorative plants, though as specimens of novelty, rarity, or skill, they have been a long way first. Here it will be seen the mistake has been made from the lack of the judicial faculty [And of explicit direction. Eds.]; the award has been given on a side issue; and this leads me to observe that the leading principle for guidance in judging is fitness—in other words, the awards must go to the collections in the order in which they comply with the requirements of the schedule, expressed or obviously understood. This may be further illustrated in the case of fruit. Prizes are offered for “A collection of fruit, six kinds, dissimilar.” Here, although not set forth in words, it is clear to most people's common sense that the prize is intended to go to the collection which is best from the consumer's point of view at dessert time; for fruit is primarily grown to be eaten, and that fruit which has the finest flavour, and in other respects is best for dessert, ought to score the heaviest number of points, unless there be some very serious drawback, resulting from slovenliness or carelessness in staging, such as bruising the fruit, &c., which is not likely to happen with experienced exhibitors. How often, however, the first prize for fruit gets awarded to mere bigness or handsome appearance, without reference to the essential quality which makes it fit for the dessert table. If, however, as often happens when our most skilful cultivators are exhibitors, there is in combination flavour, and size, and beauty of appearance, then we have perfection. But it is much more usual to have fine flavour and medium size; or large size and handsome appearance with second-rate flavour. These are the cases where real judgment is needed to award the prizes properly. According to the rule of fitness, the prizes would be distributed in the order in which the instances supposed are named.

Vegetables, again, being intended for food, and being valueless in proportion as they are unfitted for food, their use for the dining-table is clearly the first thing to be considered. Take the case of Peas. Mere size is nothing to the purpose. Who would give the prize to a great overgrown delusion, like some sorts which could be named, if an equally well grown Pea, smaller and less showy, but of the first degree of excellence as food, be shown in competition? And yet how often the largeness of the pod carries the day! So with other vegetables, and with none more than Potatoes, where good looks, without reference to other merits, get all the honours. Of course I am fully aware that without the test of good cooking it is impossible to decide on the merits of novelties. These, however, are usually the exception. The bulk of exhibits will consist of kinds the edible qualities of which are known, and a consideration of those qualities should, I think, always have due weight with the judges in deciding how the prizes are to be awarded.

The vexed question of open or close judging is one which must not remain unnoticed. It is strange to my mind that any doubt should exist on the subject. Given competent judges, and it is a matter of the supremest indifference whether they know, or are ignorant of, the names of the exhibitors. The secrecy of the one system entails a lot of trouble, and does good to no one. On the other hand, open judging is simple, and liable to no abuse except in the opinion of those whose experience is very narrow, or of a sinister kind. You certainly put all the onus on the judges if they have it in their power to know whose exhibits they have before them; even if you suppress this information, they, in the more important classes at all events, usually know at a glance whose property this, that, or the other collection is; and if it were possible for our best judges to allow considerations of ownership to influence their awards, the secret system certainly is, of the two modes, that which offers them the security of supposed ignorance.

My own opinion is that the simplest is the best plan, and that the really important point is to secure the services of the most efficient judges obtainable. There is a plentiful supply of "good men and true," from whom a selection can be made. Give them timely notice of being wanted, and pay their expenses, and they may be had when required; you may then trust such men to give their decisions with absolute fairness, whether they judge under the close or open system. In small local shows competent men are invariably forthcoming from the immediate locality; but in shows of any extent, and in all where there are open classes of sufficient importance to attract exhibitors from a distance, the judges should be the most able which the country possesses.

As soon as the awards in a class are made, the messenger in attendance on the judges should convey the official result, on properly prepared slips, to the secretary, and the prize cards should be filled up and sent to the lieutenant in charge of the tent, who should be responsible for placing them properly. By this method the prize cards will be affixed before the exhibition is opened to the public, and the reporters will be spared the waste of time which invariably occurs when this plan is not followed.

And here I must say a word in the interest of reporters. They ought to have every facility afforded for seeing the exhibition before visitors are admitted. If they are competent to criticise the awards, it is all the more important that they should see the exhibits almost as soon as the judges; for if the day be a hot one, the lapse of an hour may produce changes which will cause the awards to seem unjust. If, however, the reporters are not capable of judging the exhibits, then every assistance should be given them in obtaining materials, which they will subsequently work up into a report for the edification of the outside world. It would be well if newspaper proprietors could be induced to secure the services of horticulturists in preparing their reports of flower shows, for in nothing are the ignorance and inefficiency of the ordinary reporter more frequently displayed than in the columns filled with details of such exhibitions; and thus they come to be regarded as beneath contempt by those who know better, while to the general public they are often most misleading. Even in the columns of the "leading journal" the flower show reports are often as defective as in those of country dailies; this, with the mass of horticultural specialists in London and its neighbourhood available for the requirements

of journalism, is something strange. It is, however, none the less true; and so it comes to pass that only very rarely, except in the horticultural press, is it possible to read the report of a flower show so as to glean information and instruction.

I shall have a few words to say on the best way for the entries to be registered as they come in to the secretary, how they are to be treated afterwards, form of judges' books, exhibitors' cards, prize cards, &c., and then I shall bring what I had to say concerning flower shows to a close. *G. E. R.*

(To be continued.)

### MALFORMED SWEDE.

MESSRS. CHARLES SHARPE & CO., of Sleaford, send us photographs (figs. 57, 58) representing a curious state of things in a Swede grown near Nairn, in Scotland. It

FIG. 57.—TURNIP-FINGERS.

is not difficult to imagine the superstitious feeling with which our ancestors, who attributed such powers to the Mandrake, would have regarded such a sign-manual. A surgeon would probably long to plunge

FIG. 58.—A USEFUL HAND.

his lancet into the swollen tissues, and let out the matter ere the disease extended to the bones; a farmer would recognise a marked form of "finger-and-toe," and a botanist would see in it a reversion to the branching more or less woody root of the wild Brassica. For the purpose of helping the illusion the photographer has reversed the natural position of the roots, so that its hand-like character is the more perceptible, and its root-origin less conspicuous.

HYACINTHS AND AMARYLLIS.—It was announced on Tuesday that at the afternoon meeting of the Royal Horticultural Society, to be held on the 23d inst., Mr. Shibley Hibberd will deliver a lecture on the Hyacinth and Amaryllis,

### HARDY PRIMULAS.

THE introduction to the schedule of the National Auricula Society of a class for "hardy Primulas" will doubtless lead to the display—with the Auriculas, Polyanthuses, &c., staged next month in the competition—of many allied plants that have not hitherto received the encouragement by prizes that they deserve. With a hearty desire to express the warmest sympathy with the objects of the committee, it is not in a hypercritical spirit that I call attention to the wording of the conditions as affecting this class in the schedule, that is not quite as clear as could be desired. The words, "other than those admitted to preceding classes," are probably intended to shut out all species allied to the Auricula, Polyanthus, or Primrose; and it is therefore no doubt correct to conclude that all species or progeny of *P. Auricula*, *P. elatum*, and *P. acaulis*, are excluded. [Yes. EDS.] Then there is the wording—"Six, at least, to be distinct species." [*i.e.*, to represent distinct species. EDS.] The exception to be taken to this is that it does not clearly specify whether the stipulated plants shall be *bonâ fide* species or any progeny of species. Had the condition been made to read, "Six, at least, to be of distinct species," no room for doubt would have been left. Thus, two plants of any species may be shown; but should the two plants include varieties of the species, and not the *bonâ fide* species, what then will be the ruling? [The conditions would be met. EDS.] As, for instance, *Primula intermedia* and *P. nivalis* are very charming early blooming kinds, and both might well be included in such a class of twelve plants; but it is doubtful whether either can lay claim to be regarded as an original species, as it is generally admitted that *P. viscosa*—or, as it is sometimes called, "ciliata"—is the progenitor of these two pretty kinds. Then again we have the section represented by *P. denticulata*, which includes *P. purpurea*, *P. pulcherrima*, *P. capitata*, and *P. kashmiriana*; for all of these are so closely allied to *P. denticulata* that it is difficult to say which is the true original species and which the varieties. The Japan *Primula amoena*—or, as it is now perhaps most properly termed, *P. Sieboldii*—also shows great variety, whilst the identity of the original species remains in doubt. *Primula cortusoides* has long enjoyed the credit of being the progenitor of all the large-flowered *amoena* varieties, but that seems to be doubtful, and the kind we call *P. amoena* may be the original species, but of that we are not assured.

If in relation to these three sections the wording of the schedule is to be read literally, exhibitors may be expected to remain in some doubt as to what they may stage. Large and varied as is the *Primula* genus, it must not, however, be assumed that it will be easy to obtain representatives of six distinct species in bloom at once. *Primulas* bloom over a lengthened season, and all are not in bloom at once, therefore it is well to know just what kinds are most likely to be in flower on or about April 20 next. At such a time late plants of the *denticulata* group should be a strong feature, and good plants of *denticulata* and *purpurea* would be of great value. Then the *viscosa* or *intermedia* section usually blooms with the Auricula, and make very effective masses. Plants of the white and purple kinds would make pleasing features. *Marginata*, so distinct by reason of its serrated mealy-edged leafage, should make a useful addition, as also should *P. involucrata*, because of its distinctiveness, although not particularly effective. Then there is the mealy or farinose section, of which good plants of *P. farinosa* and *P. scotica* might be expected to be in bloom. The popular *P. japonica* would, of course, prove a valuable and an effective variety, as also would *P. verticillata*—or *abyssinica*, as it is more commonly called—which gives good heads of a yellow hue that should be represented. *Primula sikkimensis*, as a rule, blooms rather later into the season, but if a good plant of that could be secured in flower, it would also give a very pleasing yellow.

The *Primula amoena*, or *Sieboldii* group, give such variety—and these are, as a rule, so full of bloom just at the end of April that no difficulty should be found in making up suitable representatives. Accepting *Primula capitata* and *P. kashmiriana* as distinct species, either of these, if in bloom, would give excellent variety; whilst no hue of colour would be more taking than that given by *Primula rosea*, one of the most beautiful of all recently introduced species.

It will thus be seen that, assuming that the condition in the schedule referred to is not to be taken

literally, there is plenty of material out of which to form a very attractive class on April 20—provided, of course, the various kinds can be induced to bloom simultaneously, a matter that forcing or retarding cannot always ensure. That there may be a good display of hardy Primulas is to be desired. The committee have broken out boldly from the beaten florists' track in forming the present year's schedule of prizes, and good results will encourage them to go yet further in this desirable direction. *A. D.*

## Notices of Books.

**The Trees and Shrubs of Fife and Kinross.**  
By John Jeffrey and Charles Howie. Printed for private circulation by Reid & Son, Timber Bush, Leith.

This is a splendid volume, which will excite some wonderment among those who are of the opinion of old Sam Johnson as to the existence of trees in Scotland. For our own part, prior to the publication of this volume, we should have owned to a similar feeling with reference to the kingdom of Fife. The work consists of a series of well-executed photographs of various trees, accompanied by letterpress descriptions and records of noteworthy specimens, with dimensions and other useful information. The work has evidently been a labour of love, and the rather numerous errors, typographical and other, do not materially detract from the value of the book. Among the more remarkable trees illustrated are a noble specimen of the Sweet Chestnut, *Castanea vesca*, growing at Cockairney to a size which we should not have expected it to reach in the east of Scotland. The Pear at Lindore Abbey is, or rather has been, a fine timber tree, reminding us of those grand specimens near Worcester. Sycamores (*scoticæ* Planes) may be called the glory of Scotland, for nowhere are finer specimens to be found; their dense, massive, richly-coloured foliage makes them specially remarkable. We note also a tree of *Abies nobilis* at Mugdrum as having attained a height of 40 feet, while *A. Douglasii* is cited at no less than 83 feet in height at Den Raith.

With reference to the Larch, we are told that the so-called parent Larches at Dunkeld, illustrated in our columns, 1876, vol. v., p. 209, have no right to that appellation, inasmuch as it is stated on the authority of Sir John Murray Nasmyth that the first Larches introduced into Scotland were planted at Dawick Stobo from seed brought by his grandfather from Tyrol in 1725—six years before those at Dunkeld were planted. The authors remark of the Larch that it requires to be planted in sheltered situations on the sides of hills where the land is sandy, although poor. It does not grow well on cold wet land, although "it is worthy of notice that some of the largest and soundest Larches are growing on the banks of streams." In 1875 some of these trees were much broken and a magnificent one is decaying slowly. It seems odd to find mention made of *Vinca major* and *V. minor* among the trees and shrubs, and it is perhaps even more strange to learn that *Benthamia fragifera* produces fruit so far north. It is true the shrub has the protection of a wall.

An interesting note is appended to the account of the common Spruce. "At Blair Adam it was found that where Scotch Firs had failed as nurses in exposed places, Spruce Firs succeeded, and that although they got blasted on the leaves and branches from the force of the south-west wind they did not die but served as nurses to the other trees until they were taken away. They thus left the outer edge of the wood handsome and uninjured."

As it is possible that a reissue may be demanded it may be well to recommend, that in the event of a new edition being called for, the proof-sheets be more carefully supervised, as the typographical errors are unusually numerous. A heading like the following grates upon the reader's sense of the fitness of things:—"CONIFERÆ TREES.—This well known genus is very ornamental and beautiful." Then follows:—"The Spruce Fir family," "the Hemlock Spruce family," "the Silver Fir family," and so forth. *Æsculus Hippocastanum*, with a notice of which the work begins, is now known to be a native, not of Asia Minor, as here stated, but of Greece. The account of *Cytisus purpurascens* (not *purpureus*, as here printed) requires rewriting, as it conveys an altogether wrong impression as to the history of this remarkable tree.

## Forestry.

**VALUE OF SCOTCH FIR PLANTATIONS DURING FIFTY YEARS' GROWTH.**—As Mr. Michie still thinks right to set aside altogether the reports I have submitted to him from experienced foresters, and on which my estimate of the profits from Scotch Fir plantations were based, there is no use in supplying him with any additional testimony to be treated in the same way. I must remind him that these reports are still before him, and until he or some one else proves them to be untrustworthy I shall hold them to be authentic examples of Scotch Fir plantations which have realised from £75 to £100 and upwards per acre during fifty years' growth.

As the case stands, it is not enough for Mr. Michie to say that the evidence is unreliable merely because it does not happen to coincide with his local practice and experience.

At present I shall not continue a discussion into which a good deal of somewhat irrelevant matter is being introduced; but it would be well to note Mr. Michie's evidence so far as it supplies facts which may be found useful for future observation. Mr. Michie has given us several examples of the results of the plantations under his charge; and I gather from his reports that in no case have any of his woods yielded half the returns obtained from Fir-wood plantations elsewhere, nor can he see any prospect of any improvement in this respect after a careful inspection of all the plantations on the immense Seafeld estates.

Will Mr. Michie kindly enlighten us further by informing us if he does not think that the slow growth of the trees, and their inferior value when young, when compared with other more successful plantations, may be accounted for by some exceptional conditions of soil and exposure, and consequent management, peculiar to the district? It is certain that in Morayshire, a neighbouring county, far more favourable results have been obtained from Fir plantations.

This discussion has been confined to Scotch Fir plantations, but many remarkable examples of Larch and hard wood could be given where the returns per acre have been far above plantations of Scotch Fir alone. *Wm. Baxter Smith, 4, Salcombe Villas, Merton.*

## Garden Operations.

### KITCHEN GARDEN.

**ASPARAGUS.**—Our Continental neighbours are eminently successful in the cultivation of this subject, and, through the medium of the gardening papers and periodicals, we have now become pretty familiar with the mode of cultivation which they practise to produce those extraordinary examples which we are accustomed to behold during the season in Covent Garden Market and at other places, which, as regards appearance, makes that which we produce in the old and antiquated way comparatively insignificant. In this climate it may not be possible, even though the same course of treatment be carried out in a precisely similar manner, to attain such a marked degree of success as they do in France. This, however, is as yet a problem that will be solved before long by English cultivators, as at the present time this process of cultivation, to a limited extent, is being pursued at many places. It has, moreover, been further encouraged by means of the liberal prizes which are to be given in 1881 and subsequent years for the best productions, to be grown in this particular way, and we look forward with much interest and concern to these forthcoming competitions for a practical proof of what can be accomplished by energy and perseverance combined, in the cultivation of this wholesome and valuable vegetable. The distinctive characteristics of this special process comprises the planting of individual plants, and giving them an ample area in which to develop themselves properly with the aid of careful and generous treatment in detail as required. This system, or a modified form of it, is unquestionably the proper way to get fine large "grass." In making choice of ground for this object, preference should be given to an open quarter in the kitchen garden, where by the process of cultivation it has become well pulverised, enriched, and friable in character, with an average depth of from 2 to 3 feet. After preparatory operations, as trenching, manuring, or mixing are completed, and when the soil is settled down, the surface should be made level, when it will be ready for planting. We proceed with this operation immediately we see the growth of the seedling plants coming out of the soil, and we prefer plants two or three years old for the purpose, out of which we make a selection of the best and strongest. For individual roots we make the lines 4 feet apart, and put

the plants in these 3 feet asunder, for which we make circular holes about 3 inches deep and 18 inches in diameter. In planting, the crowns are slightly elevated, the roots evenly distributed over the surface, and carefully covered over with fine rich soil, which is pressed down firmly about them by the hand; after which a small stake is placed in close proximity to each plant to indicate its whereabouts and to secure the growth from damage when it becomes indispensable; after this 2 or 3 inches of rich well decomposed manure is spread over the surface of the soil which is occupied by the roots, as a means of protection against aridity and to give nourishment to the plants.

In forming beds we deviate from the old method, inasmuch as in each bed we only have two rows of plants, which are placed so as to be 2 feet asunder every way, virtually representing the French plan in a minor form. At the time of planting the ground should be made even, each bed should be marked out 4 feet wide, with 2 feet for alleys between them; take 2 inches of soil off the bed, make two longitudinal lines a foot on either side of the centre of it, and dot out the places for the plants in these 2 feet apart, carefully spread out the roots on the surface, replace the soil again and press it firmly about the roots, and stake and mulch the surface as in the case of individual plants. It is not our intention to abandon this method altogether, as we find these plants well adapted for forcing requirements, as well as providing good samples of Asparagus in its season. The requisite attention should now be given to forking over the beds, and at a seasonable time the surface should be raked over to rid the bed of any material which is calculated to interrupt the free growth of the young shoots, which ere long will be starting into life. Seed should also be sown now either broadcast on beds or in drills about 18 inches apart.

A period of tolerably fair weather has enabled us to complete the sowing of Onions, Carrots, Parsnips, and the various kinds of the Brassica tribe for the general crop. We have also planted breadths of early kinds of Potatoes, including Veitch's Ashleaf Kidney and other sturdy kindred kinds. These are planted in rows 3 feet apart and the sets 1 foot asunder. We allow this width between them in order to admit of the early planted Brussels Sprouts and Cottager's Kale coming in between them as soon as the plants are ready. The main crop of Cauliflower plants which have been wintered in frames should be put out without much further delay. Give them a place where the soil is rich and moist, and plant about 2 feet 6 inches apart every way. Jerusalem Artichokes, Onions for seed, Shallots, Garlic, &c., should be planted now. To accelerate growth in spring crops of vegetables it will be necessary occasionally to hoe or stir the surface-soil about these plants in order to counteract the effects which naturally result from the weather of March, and if this operation is carried out over the entire surface of the garden at suitable times during the present month it will do much towards exterminating an early crop of weeds. The early sown plants of Brussels Sprouts, &c., as soon as they are fit to be handled, should be pricked out under the protection of a light. Such places as those where Cauliflower plants have been wintered will be most suitable for the purpose.

### FORCING DEPARTMENT.

Osborn's French Bean is doing admirably with us, and is in our opinion the best of all for forcing requirements. This fact should be noted, and arrangements made for securing a due supply of seed accordingly. Carefully lay aside in soil the exhausted roots of Sea-kale, and Rhubarb roots also if they be required for planting; proceed to thin out Carrots immediately they are ready for the operation, and after the present time, if the convenience will allow, grow French Beans in pots or frames. Mushrooms are much required during the London season; for the later part of it, make up and spawn beds about the present time: these should occupy a place which is cool and moist. *G. T. Miles, Wycombe Abbey.*

### FRUIT HOUSES.

**PINES.**—According to our usual plan, we at the beginning of the current month started enough suckers to meet our prospective requirements; 5 and 7-inch pots, according to the size and variety, were used for them, and the suckers were potted firmly into good fibrous loam in excellent condition for the operation, and without being watered were at once plunged into a fermenting bed which had previously been prepared for them, having a temperature of about 95° at 9 inches beneath its surface. After ten or fourteen days have elapsed some of these will be turned out for inspection, by which time roots should be making an appearance against the sides of the pots, and water will, if necessary, be administered and applied as often as occasion requires afterwards. Owing to the natural moisture that abounds in the pit selected for this purpose but little syringing has been required as yet; this operation will, however, with an in-

creasing amount of light, heat, sunshine, and growth combined, have accordingly to be indulged in more liberally. The temperature about these plants is maintained at about 60° at night and 70° in the daytime, and a slight shading applied for an hour or two at mid-day when sunshine is powerful, and the place is closed up before its force becomes inoperative. It is also our custom to attend to the wants of those plants which we winter in 7 and 8-inch pots during this month; these plants are now removed into others of from 10 to 12 inches in diameter, in which they produce fruit during next autumn and winter months. The rough part only of fibrous loam, broken into lumps suitable in size for the shift, is prepared beforehand, and the operation of potting is not proceeded with until such time as the material is in perfect order for it. The preparation of the pots comprises perfect drainage, over which is thrown a handful of wood-ashes to prevent the inroad of worms, and we sometimes use a few half-inch bones also and scatter a few of these over the heap of potting material. In the process of repotting care is necessary in order to avoid having vacuous places in the fresh material; it should therefore be gradually placed round the old ball of the plant, and rammed down carefully in like manner. After such plants are shifted a brisk heat about the pots of 90° or 95° will be of material advantage, and now that we are more favoured with that support which Nature gives, growth should be allowed to develop itself freely: 65° to 70° at night and 75° to 80° during the daytime will be adequate for this end, of course allowing an additional 5° or 10° from solar influences. If we are favoured with sunny weather take advantage thereof in every department to close up the places under its invigorating power, and be more liberal in lightly sprinkling overhead all the plants, avoiding only such as may be in flower at the time. *G. T. Miles, Wycombe Abbey.*

## FIGS.

The fruit on the earliest pot-trees having completed their first swelling, will continue apparently stationary for a considerable time, and as this is the most critical period in their culture they will well repay careful attention to detailed management, as any check that may be caused by excessive heat or want of moisture will in all probability cause them to drop when the time arrives for them to commence their last swelling. Should the weather continue mild, a slight rise in the night temperature will do no harm, 60° to 65° will be quite sufficient for the present, but in the event of a return to cold weather 5° lower will be found safer than following the hard and fast line at this changeable season of the year. To compensate for the apparent loss of time considerable license may be allowed at closing time by shutting up with plenty of heat and moisture, when a rise of 10° to 15° may be indulged in without producing weak or elongated growths. Copious syringing on all favourable occasions will be absolutely necessary, as red-spider, one of the most troublesome insects with which we have to contend, is almost sure to attack the leaves in near proximity to the pipes. Another important point is a steady supply of tepid liquid to the roots, as Figs when in full growth require generous nourishment, providing it does not remain stagnant—an event which is scarcely likely to happen where the pots are elevated on dry brick piers well above the floor of the pit. Pay attention to thinning and disbudding in the succession-house if there is any probability of the growths becoming crowded, and stop at the fourth or fifth leaf should it be thought desirable to form spurs from which the second crop of fruit will be obtained. Syringe the trees twice a day, and keep the mulching constantly moistened with diluted manure-water. Pot on young trees intended for forcing next year, and place them in or over bottom-heat; shade slightly from bright sunshine for a few days, until they show signs of having taken to the new soil, when they may be fully exposed to sun and light. *W. Coleman, Eastnor.*

## ORCHARD-HOUSE.

If the instructions given in previous weeks have been followed the trees will all have been pruned, and the buds will now be showing their beautiful pink colour. If the trees have not been pruned it should be done at once; there is no difficulty now to see which are flower-buds and which leaf-buds, only many persons will not prune their trees until the buds are quite prominent. Perhaps it is safer for beginners not to do so until the end of February or early in March. We may have cold frosty weather yet, but as far as one can judge from the state of the weather during the two first months in the year, we may hope that March and April will be comparatively free from sharp frosts. It may be as well not to maintain a high atmosphere at present, it is better to let the buds expand slowly, for two reasons—first, the later they open the more likely is the weather to be favourable to the proper development and setting of the blossoms; and in the second place the blossoms themselves are of greater substance and the reproductive organs are more perfect, consequently they will set better. I advise plenty of ventilation by day at present, and the ventilators may also be left open a little at night,

On a calm night fill the house full of tobacco-smoke; I like to do this before the blossoms open, even if there is not any greenly, for it is undesirable to fumigate after the blossoms open, as it may probably prevent a good set. In the early house the blossoms are now set, and the fruit swelling well. When the fruit is as large as Marrow Peas a portion of it may be thinned out; perhaps half of it has set well, if it has not done so it is better to thin cautiously. The trees ought to be syringed at least once a day, in dull close weather in the morning, and on bright sunny days in the afternoon, as well as when the house is shut up between 3 and 4 o'clock. I must again urge the importance of supplying the trees with sufficient water at the roots: an inexperienced cultivator may easily err in this, especially if the trees were top-dressed instead of being repotted; the surface-dressing may be wet enough, and the portion of the soil underneath, in which the roots are closely pressed together, may be quite dry: to prevent this give a thorough watering to saturate every part of the ball. Strawberries on the shelves are now either throwing up their trusses of flower or the blossoms are open. Allow sufficient space between each plant, and also give plentiful supplies of water, but it is not desirable (as some advise) to place saucers underneath the pots, which are kept full of water. *J. Douglas, Loxford.*

## ORANGE-HOUSE.

In the case of trees where the fruit is set, and has increased in size, it is essential that all such should be kept in a house where there is a high temperature; 65° or even 70° is not too much, but this must be accompanied by sufficient atmospheric moisture. Shut up early in the afternoon to retain the sun-heat. If the temperature runs up to 85° after the house has been shut up in the afternoon with sun-heat it will do the trees good. Give them a thorough syringing at the same time. Syringe the trees, walls, and paths of the house early in the morning. Surface-dress with rich compost, or apply manure-water as the trees seem to require it. Those that have no fruit upon them may be placed in the orchard-house for a time. I must again urge the importance of cleanliness in the house when the trees are fruiting. Allow no insect pests to gain a footing upon the trees. If they can be made perfectly clean at this season they may not be any trouble afterwards. *J. Douglas, Loxford.*

## PLANT HOUSES.

ORCHIDS.—The period through which it is most advisable to allow the majority of these plants to make their growth has now commenced, and the great object of the grower will be to give them every assistance while doing so. In every department the atmosphere for twenty out of the twenty-four hours should be as regards moisture near to the saturation point. The exceptional four hours should be in the middle of each day, when it is good practice to allow the atmosphere in each division to become several degrees drier, thus allowing the plants the opportunity of discharging from their systems all superfluous moisture which otherwise would prevent sound, lasting growth. In such moist, mild, dull weather as we are now getting, two light dampings down each day will be sufficient in either house, but with more sun and dry high wind; three thorough dampings down each day will be required.

The great fear which was experienced during the winter of over-watering has now passed away, and in all probability more plants will suffer from dryness at the roots from now till October, than from wetness. The cool-house *Masdevallias* and *Odontoglossums* will, if they are properly potted, need a thorough soaking at the roots every four or five days. The *Disas* should be watered every morning, but not syringed overhead till we get bright summer weather. Such *Oncidiums* as *macranthum* and *serratum* must be kept wet, and the aerial roots of the rambling *zebrinum* will take a thorough moistening at least once a day. The majority of the *Laelias* and *Cattleyas* grown in pots will be content with one watering about every six or eight days, those in baskets and on blocks more. In the East Indian-house such plants as *Aerides*, *Vandas*, and *Saccolabiums* must be watered often enough to keep the sphagnum surrounding their roots green as compared with the white look it carries during the resting season. Plants on bare blocks in either division must be watered at least once a day.

It is now time to return the resting plants of *Vandates*, *Renanthera coccinea*, and *Dendrobium Falconeri*, to the East Indian-house, in which a light position and abundance of water should be given them, as no gain is likely to accrue from prolonging the resting season. The gigantic form of *D. Falconeri*, sent out by the Messrs. Veitch, and which was described in this journal by Prof. Reichenbach, is now flowering, and proves to be a splendid Orchid. In habit it is far more robust than the type, and flowers down its strong unbranched pseudobulbs in the same manner and as freely as *D. Wardianum*. The question has often arisen in my mind, Is this plant a wild hybrid, having *D. Falconeri* and *D.*

*Wardianum* for its parents? Another very beautiful and rare *Dendrobium* in flower is *macrophyllum Huttoni*: it is in reality a slender growing *macrophyllum* with pure white sepals and petals. The powerful *Rhubarb* scent given off by the flowers of the type is scarcely perceptible in the variety. Both plants during the growing season should be suspended in baskets in the hottest division; a thin layer of sphagnum and fibry peat will suit them to root in; their resting temperature should not be lower than 55°. Plants of *D. Cambridgeanum* that have been wintered in the cool-house will now be showing flower along with the young growth, and will be all the better for more heat and moisture. The winter flowering *Angraecum sesquipedale*, *virens*, and *eburneum* should, if they require more roots room, be at once seen to, as growth will soon commence. Crocks, charcoal, and sphagnum is sufficient for them: when even the best peat is used it speedily gets too much decayed for the roots of these plants. The small growing *A. citratum*, now flowering, is certainly one of the most elegant and charming Orchids under cultivation: those who have been accustomed to see this plant with two or three weak spikes would be surprised at the effect of strong imported plants carrying eight or more. Pot or basket this plant in crocks and sphagnum, and keep it the whole year round hot, close, and moist. Plants of *Odontoglossum citrosimum* will now be fast pushing their spikes, and will take a thorough soaking of water about once a week; the resting season with these is now over, and no amount of dryness at the root will now cause plants to flower that have not been properly rested. The present is the proper time to basket or pot plants of *Laelia autumnalis* and *L. albida*. Neither of these plants hold their roots in any close material, such as compressed sphagnum or peat; give them crocks and charcoal, and a thin top layer of peat fibre. They prefer to be kept rather dry at the root, in a moist, airy, warm atmosphere. Any overgrown specimens of *Ceologyne cristata* should now be carefully broken up and potted in well-drained peat and sphagnum: eight-inch pots are quite small enough for this purpose, as every leading growth should be well backed up with older bulbs, which are, indeed, the backbones of the plants. *J. C. Spyers, Burford Lodge, Dorking.*

## TOWN GARDENING.

Spring flower gardening in town is anything but encouraging, for in not more than one season out of half a dozen do we get sufficiently genial weather for the generality of spring flowers to come to perfection before the beds are required for the summer occupants; and therefore to try to do the two well on the same beds is, in my opinion, a mistake. It is only in places where the greater part of the spring flowering plants can be kept in cold houses or frames through the winter that it can be carried out to any extent in town. There are several plants, however, that will stand out, and amongst these may be mentioned *Alyssum saxatile*, *Arabis alpina*, *Armeria alpina*, *Iberis sempervirens*, &c. These planted in groups of threes on the side of the mounds bordering the shrubberies have a very pleasing effect, especially when *Crocuses* or *Tulips* stand at irregular distances grouped in the same manner. I have tried several seasons to get *Primroses* and *Violets* to bloom, but with unsatisfactory results, and *Snowdrops* do but very little better. *Herbaceous Phloxes*, *Antirrhinums*, *Pentstemons*, *Pansies*, *Silenes*, *Myosotis*, and all other spring flowers wintered in houses or frames should now be planted out. Do not sow half-hardy annuals on borders too early, there is nothing gained by early sowing. Prick off all subtropical seeds when ready, and place them in a heat of 70° to 80°, to get them as strong as possible preparatory to hardening off.

Roses do not give satisfaction in town, and try all you may, either indoors or out, there is no creditable result. Many of the strong-growing and robust sorts will make wood, but flowers, the principal object aimed at, are either deficient or deformed. Nevertheless *Roses* are so much sought after that one is wont to try, even if one only gets half a Rose. I find those that do best here are the old stumpy plants of the strongest growing kinds of *Hybrid Perpetuals*, which may be bought at any of the Rose growing nurseries—I mean those of four or five years' standing in the nursery; they seem to have a constitution which stands the smoke better than the younger plants of the annual sales. The only Tea Rose which with me gives any satisfaction is *Gloire de Dijon*, and that is planted against a south wall. *Roses* should be pruned now; they are getting rather forward, and delay might prove injurious to them. They should not be pruned too close in town; it is better to thin the shoots out, and top the ends of those that are left. It is also a good plan to lift the strong growers in the autumn every two years, prune the roots, and replant them in good stiff yellow loam, with a very little manure. Manure, without the roots of *Roses* are confined, only increases the development of shoots in the strong growers and lessens the production of flowers. *Wm. Gibson, Royal Hospital Gardens, Chelsea, S.W.*

## APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, Mar. 15	Sale of Importations of Rare Orchids, at Stevens' Rooms Sale of Established Orchids, Lilies, &c., at the Mart, by Protheroe & Morris.
TUESDAY, Mar. 16	
WEDNESDAY, Mar. 17	Manchester Botanical and Horticultural Society's Show (two days) Spring Flower Show at Clifton (two days) Sale of the late Mr. Serjeant Cox's Collection of Orchids, at Stevens' Rooms (and two following days) Sale of Roses, Fruit Trees, Herbaceous Plants, &c., at Stevens' Rooms
THURSDAY, Mar. 18	Meeting of the Linnean Society, at 8 P.M. Sale of 8000 Liliun auratum, from Japan, at Stevens' Rooms
SATURDAY, Mar. 20	Sale of Hardy Plants and Bulbs, at Stevens' Rooms

ON more than one occasion during the last few years we have taken the opportunity of alluding to the practical application of the ELECTRIC LIGHT for forcing purposes. Those who were present at the evening *fete* of the Royal Horticultural Society on May 27 last must have felt that the electric light was capable of being put to more important use than the mere lighting up of a flower show. Some practical gardeners, not unnaturally, were at first loath to believe in the possibility of any useful application of the light to their purposes, while others, more far-seeing, looked at the matter only from the pounds, shillings, and pence view, and decided, rightly so, at present, that it was not likely to be of immediate practical benefit. Oddly enough, most of the gardeners to whom the subject was mentioned said, "Oh, yes! but what about the heat?"—as if, quite apart from any heat that might be diffused from the incandescent carbon of the electric lamp, heat was not as much under their control already as is the supply of water. We are happy to say the matter has advanced a stage. What was chiefly a matter of hypothesis is now an ascertained fact. The growth of plants is now proved to take place under the influence of the electric light, and although matters are still in their infancy, enough has been definitely gained to show that, in the future at least, the gardener may be able to avail himself with advantage of the electric light, and ultimately set the dark, foggy days of winter at defiance as he does already their low temperature. Heavy coal bills and persistent obscurity—evils our gardeners have had to contend with lately with more anxiety than ever before—stand now a good chance of being very materially abated.

It was already known in a vague sort of way that the action of the electric light on vegetation was similar to that of the solar ray; but practical proof, such as would carry conviction to the unscientific mind, was wanting. This has now been afforded, and to Dr. SIEMENS, to whom we owe so much already in the matter of the application of the electric light to light-houses, such as that of the South Foreland, is due the credit of being the first to place the matter on a practical basis.

At the meeting of the Royal Society on the 4th inst. Dr. SIEMENS gave orally an account of his preliminary experiments, and exhibited illustrations of the power of this new agent in promoting vegetable growth.

The method pursued was to plant quick-growing seeds and plants, such as Mustard, Carrots, Beans, Cucumbers, and Melons, in pots, and these pots were divided into four series, one of which was kept entirely in the dark, one was exposed to the influence of the electric light only, one to the influence of daylight only, and one to daylight and electric light in succession. The electric light was applied for six hours each evening—from five

to eleven—and the plants were then left in darkness during the remainder of the night. The general result was that the plants kept entirely in the dark soon died; those exposed to the electric light only or to sunlight only thrived about equally; and those exposed to solar light first, and then to electric light after sunset, thrived far better than either, the specimens of Mustard and of Carrots exhibited to the Society showing this difference in a very remarkable way.

Dr. SIEMENS thinks the experiments already made are sufficient to justify the following conclusions:—1. That electric light is efficacious in producing the green colouring matter in the leaves of plants, and in promoting growth. 2. That an electric centre of light equal to 1400 candles placed at a distance of 2 metres from growing plants appeared to be equal in effect to average daylight at this season of the year; but that more economical effects can be obtained by more powerful light centres. 3. That the carbonic acid and nitrogenous compounds generated in diminutive quantities in the electric arc produce no sensible deleterious effects upon plants enclosed in the same space. 4. That the plants do not appear to require a period of rest during the twenty-four hours of the day, but make increased and vigorous progress if subjected during daytime to sunlight and during the night to electric light. 5. That the radiation of heat from powerful electric arcs can be made available to counteract the effect of night frost, and is likely to promote the setting and ripening of fruit in the open air. 6. That while under the influence of electric light plants can sustain increased stove heat without withering—a circumstance favourable to forcing by electric light. 7. That the expense of electro-horticulture depends mainly upon the cost of mechanical energy, and is very moderate where natural sources of such energy, such as waterfalls, can be made available.

The specimens shown proved very clearly that plants grown under continuous light—that of the sun by day and that of the electric light by night—surpassed in vigour and rapidity of growth those submitted to solar light only. Plants grown under the continuous agency of light in this manner grow, in point of fact, under pretty much the same conditions as those which grow under the continuous daylight of the arctic regions in summer. It was only the other day that we were commenting on the effect of the prolonged light in developing the colour and aroma of plants grown in Norway or on high mountains—effects obvious to the least observant traveller, and now there is good reason to believe that similar results will accrue from the continuous use of the electric light. Objections have already been raised on the score of the ill-effects of this continued strain and want of rest to which plants so treated must be subjected, but this is of little consequence in the case of annual plants, and in those of longer duration the matter will not be of very great consequence, as a continuous supply of new plants can readily be obtained if such be found to be needed.

Dr. SIEMENS' experiments were but the rough beginnings of other more precise ones, which we may hope will be forthcoming in due time. We want accurate information as to the quality and amount of the work done by plants subjected to the electric light, the quantity of colouring matter, of starch, of sugar, of gluten, of alkaloids, of oils, and what not, which are produced under given conditions. Specially is it desirable to eliminate those effects known to be produced by heat, and to discriminate them from those the product and outcome of light. It was unfortunate, in this respect, that a point should have been made as to the unfolding of Tulip flowers when exposed to the lamp, the unfolding being rather due to heat than to light.

In the case of a forced Lily of the Valley it is the heat which causes the development of the flowers, while the want of light is shown in the tardy growth, flimsy texture, and light colour of the leaves—all points which the electric light might be expected to remedy. In the the solar beam the light-giving rays are known to have very different effects from the heat-rays, but we greatly stand in need of clear definite notions as to the work done in the plant itself under the influence of these varying conditions. It is certain that Dr. SIEMENS' experiments will be repeated and extended. It is most desirable for the sake of future solid progress that they be carried out at first almost entirely from a scientific point of view, because in no other way will a sure basis be obtained, and certain as distinguished from fortuitous progress be made. But in the meantime, as purely scientific experiments are little likely to find sympathy among practical gardeners, experiments should forthwith be started, with a view to show how rapidly and how efficiently what are known as forcing operations may be promoted by this new agency. Every one who, having seen the results obtained by Dr. SIEMENS, and who knows the difference between a well-coloured bunch of Grapes and one less perfectly finished, and who can appreciate the different Covent Garden value put upon the two, will be able to appreciate the potentialities of the electric light, and will look forward with interest to the experiments that are sure to be made. Already we hear that it is possible experiments may be made at Kew, under the auspices of the Scientific Committee of the Royal Horticultural Society, and we earnestly wish them success.

To come back to the coal bill, we may mention that in some of Dr. SIEMENS' experiments the heat evolved from the lamp was so great as to singe the leaves, and to necessitate the removal of the plants to a greater distance, while in other cases the hot-water pipes had to be covered with non-conducting material, in order to bring the temperature down. These things being so, it is clear that the objection, now perfectly valid, as to the cost of the electric light, will be compensated for in the future by the lessened cost for fuel and labour.

— PINUS MASSONIANA.—The woodcut at p. 337 (fig. 59) serves to illustrate the veneration with which the Japanese regard certain of their Coniferous trees. The Pine in question, as SIEBOLD tells us, is indispensable to the true Japanese, and is found in his garden in groves surrounding the temples of his saints and gods. Its branches adorn the great portal and the place of honour in the reception hall, and find a place on the sepulchral monument. On the high-ways avenues of this Pine serve as landmarks, and in the gardens of the wealthy this Pine is grown as a dwarf in a flower-pot, or allowed to tower aloft as a giant in the open garden. The trees in the present case are planted in a cemetery, and overshadow the image of one of their divinities, seen on the right of the reader. Respecting this BUDDHA, Mr. MOSELEY, one of the naturalists in the *Challenger* Expedition, whose delightful and most suggestive book we had occasion to mention some time since, calls attention to the singular circumstance that the divinity of a straight-haired race should be represented with curly hair. The bronze circle around the back of the saint's head recalls the nimbus so often represented in the case of Christian saints. This nimbus, then, there are grounds for believing to be a survival or adaptation from Buddhism. Our illustration was taken from one of Mr. MARIES' characteristic photographs of Japanese scenery and vegetation.

— THE ROCKWORK AT CHISWICK GARDENS.—Mr. BARRON seems determined that Chiswick shall be as full of interest as with limited resources he can make it. Several features of more than ordinary interest will be afforded to visitors during the spring and summer months. On the rockwork there are some very pretty subjects, the little bays of *Crocus Imperati* blooming with re-

markable freedom, the soft rich mauve coloured petals being in marked contrast to the golden-buff sepals. The true *Crocus aureus*, said to be very scarce, is remarkable for its clear golden flowers, quite unlike the strain ordinarily grown under this name. Some pots of it in a cold frame are in fine form. The large clumps of *Hepaticas* that have been suffered to grow into size are now full of blossom; the large mauve blue *H. triloba* Barlowi is particularly noticeable, and so is the pretty single white, *Saxifraga*

of flower. The herbaceous border having been rearranged, some of the flower-beds planted with fresh subjects, while other beds are in preparation for the reception of subjects, there is full promise that Chiswick will become a real school of instruction during the summer and autumn months.

— PERFECTION IN THE CINERARIA.—The tribunals existing thirty years or so ago to which florists' flowers were submitted made a great point of

Master Harold, from Mr. JAMES' collection, which was awarded a Certificate of Merit by the Floral Committee on Tuesday last; but there was a want of artistic finish in the flower, consequent upon the disc being greyish-white, and the thin ring of white round this was rugged in appearance and indefinite in outline. A perfect tricolored *Cineraria* should have all its parts in striking contrast, but in this particular case the grey disc confused the white ground, and spoilt both. A single bloom of similar character, in

FIG. 59.—PINUS MASSONIANA IN A JAPANESE CEMETERY. (SEE P. 336.)

*Burseria* is being succeeded by *S. oppositifolia*; *S. pyrenaica rubra*, a darker coloured form much larger in the flowers; *S. oppositifolia alba* and *S. retusa hypnoides*, smaller in size and deeper in colour, the flowers forming little heads curiously divided. In one of the cold frames may be seen *Dondia Epipactis*, a singular and pleasing little plant with greenish-yellow flowers in the form of a simple umbel, and having a golden centre. A pretty little white flowered *Iberis*, obtained by Mr. MAW from the mountains of Greece, is noticeable because so very dwarf and early, pots of it in a cold frame being full

the presence of the dark disc in the *Cineraria*. If any one will look through the published records of the National Floricultural Society they will find that the dark disc—the presence of which does so much to produce a harmonious contrast, especially in the case of white-ground flowers—was characteristic of almost all the varieties certificated by that body. Of late years we appear to have become less exacting in this matter, and not a few of the varieties certificated in recent times have possessed grey or white discs. No one could call in question for a moment the massive proportions and finely rounded form of *Cineraria*

a box of cut flowers close by Master Harold, had a well defined band of pure white encircling a dark disc, with a brilliant magenta margin. In this case was presented to view a *Cineraria* as near perfection as could well be imagined.

— *DENDROBIUM LINGULIFORME*, a native of Queensland and New South Wales, is a very peculiar and interesting species; it merits mention not only on account of the singularity of its stem and leaves, but also for the elegance of its spikes of pretty delicate flowers. The thin stems—which root at the nodes—

bear rather closely set, short, fleshy, tongue-shaped leaves. The slender spikes bear about a score of white flowers, the sepals and petals being linear-acute, and the short lip strongly recurved.

— NEAPOLITAN VIOLETS.—The success that attends Mr. DENNING'S frame cultivation of the Potato is manifest also in the production in large quantities of that most delicious of all sweet-smelling spring flowers—the Neapolitan Violet. In looking along the line of frames filled with these plants, strong, robust, and healthy, and as full of fine blooms as could well be wished for, we are compelled to ask, Why this success here, and failures abundant elsewhere? It is true the frames in which the Violets are growing are placed on the most elevated ground in the Coombe gardens, and the place is also naturally high, but there must be other reasons than this, for though failures are perhaps most abundant in low-lying or foggy localities, yet some are found also where a dry atmosphere exists. Mr. DENNING, without doubt, rightly ascribes the good results he gets to the adoption of a simple principle in ventilation and aerating that is by no means so commonly understood as is desirable. Giving air to frames in all gardens means tilting the lights behind to allow the damp air to escape; at Coombe Gardens it means, in the Violet frames at least, tilting the lights both in front and behind, and keeping them so a little at all times, except during severe frosts or high winds, so that a free current of air is always passing through the frames and playing about the plants. We commend this simple plan to all who are unsuccessful in frame Violet culture; its adoption may mean to them future success, just as in the past some cause or other has brought them failure.

— THE YEAR'S WEATHER SO FAR.—The most inveterate grumblers at the weather can hardly find reason to complain of what so far has been allotted to us this year. January, usually regarded as the coldest month of the year, well maintained its reputation, for during a long portion of it the temperature was at the lowest and the cold intense, but whilst little rain fell the cold was greatly intensified by the excessive humidity of the air. February had its ancient reputation for ditch filling to maintain, and it did so to the satisfaction of all, in some cases perhaps overdoing it, but only in low-lying districts. Dry in its earlier days, it gave a good and needed rainfall in its later ones, and was in all respects a seasonable month. March, as far as it has gone, has kept up the old traditions; it came in raging with a fierce hurricane, and blew till old Boreas' cheeks must have nearly burst. With so much wind there has been no lack of dust, and kings who are imprisoned in a circle of terrible suspicion, or colonels in the hands of brigands with an eye to the handling of glittering gold, may yet hope to find abundant ransoms. To all working on the land the season has so far proved most propitious; though dried by March gusts, the soil is moist enough for all purposes, and never worked better than just now. If March keeps dry to the end we shall have such an early planting time as has not gratified us for years.

— DOUBLE CINERARIAS.—These are not of such modern origin as some have supposed. As far back as 1851 Mr. MILLER, of Mayfield, Perth, sent to one of the meetings of the National Floricultural Society a double Cineraria, which was regarded as "quite a novelty, being so thoroughly double as to thoroughly resemble the purple Groundsel (*Senecio elegans*)." Mr. R. GREENFIELD'S splendid variety, Mrs. Thomas Lloyd, with its very large and bright magenta flowers, which was so deservedly awarded a First-class Certificate of Merit on Tuesday, surpasses in size, symmetry, and fulness all we have hitherto seen, and it is said he has something even finer to follow. We had seen so little of double Cinerarias of late that there seemed reason to fear they had again fallen away from notice; but the new variety above referred to will impart a quickened interest in these flowers. It appears difficult to over-estimate their usefulness for cutting purposes.

— PANSIES IN POTS FOR EXHIBITION.—Capt. C. HALFORD THOMPSON, Colleton Crescent, Exeter, writes: "It may be of interest to those of your readers who grow Pansies to learn that some valuable

prizes will be offered at the Devon and Exeter Horticultural Society's Exhibit at Exeter, on April 16 next, for 'Pansies in pots.' The prizes are open to all amateurs, and I shall be happy to give particulars to any one requiring them. I last year endeavoured to organise a Pansy Society for the West of England, and the prizes referred to above are given from the funds then collected: but I fear that it will be useless to attempt to continue the Society, as the support received is not sufficient for a separate organisation. Pansies seem to become more popular in Scotland every year, for two new societies have been formed there recently. Some day perhaps Pansy growing will be equally popular in England, for the idea that Pansies cannot be grown south of the Tweed is an entire delusion, and if English growers would only unite I believe we could soon form a prosperous society."

— THE MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL SOCIETY holds its great show this year, as usual, commencing on the Friday before Whit-week and closing on the following Friday. The prizes are on the same liberal scale as heretofore, and the schedule is equally comprehensive. Within the seventy-three classes of which it is composed it may be said that there is a place for every kind of plant cultivated in pots, besides classes for hardy herbaceous and alpine plants, as well as several for hardy evergreen trees and shrubs. Good prizes are also offered for fruit.

— INSTITUTION OF SURVEYORS.—The next meeting will be held on Monday evening, March 15, when the adjourned discussion on the paper by Mr. W. L. HUSKINSON, entitled "The Present Depression in English Agriculture; its Real and Assumed Causes," will be resumed. The chair to be taken at 8 o'clock.

— ANGRÆCUM CITRATUM has been noticed as being a most distinct, interesting, and very pretty winter flowering species of this singular genus of Orchids. It has now proved itself to be one of the most free flowering. At present there are a large number of plants in flower in Messrs. VEITCH'S nursery, Chelsea. Some of the very smallest plants are producing flowering spikes; on very moderate-sized examples there are three and four—on one thirteen beautiful spikes, all of them with expanded flowers, forming a most conspicuous object in the Orchid-houses. Being a native of Madagascar, this species requires to be grown in a warm house; indeed, one specimen suspended from the roof amongst Phalænopsis had the longest spikes, and was in splendid health. There are scores of spikes of what may be termed the Prince of Dendrobis, *D. Wardianum*. The plants are growing in the small Orchid-pans suspended from the roof, which shows off the pendulous spikes to the best advantage. *D. crassinode* is also very fine, the strong growths, so much admired last year, are now well studded with open and opening flowers. The different species of Phalænopsis are now producing flowers freely; this they could not do earlier owing to the destructive nature of the fogs this season—nearly a quart of withered flower-buds was picked off one morning from *P. Schilleriana* alone.

— ROYAL HORTICULTURAL SOCIETY.—The unsettled state of affairs at South Kensington would seem to have no terrors for would-be Fellows of the Royal Horticultural Society, if we may judge from the number, seventeen in all, who sought election, and indeed were elected as Fellows on Tuesday last. One encouraging feature, however, of this particular election is to be found in the circumstance, that at least a dozen of the ladies and gentlemen elected came from Chiswick, or the immediate neighbourhood of that horticulturally famous parish. This is as it should be, and shows clearly and unmistakably that the use and enjoyment of the South Kensington Garden is not the sole object of all who seek election, and that there are some who appreciate Mr. BARRON'S labours at Chiswick.

— ARISÆMA SPECIOSUM.—Some fine specimens of this extremely handsome Aroid, of which a full-page illustration was given in the *Gardeners' Chronicle* for 1879, p. 585, are now in bloom in the T range at Kew. The long flexuous prolongation

of the spadix, which forms such a striking feature in this species, has attained in one of the Kew plants the enormous length of 29 inches. In the specimen figured in the *Botanical Magazine* the length was 20 inches. Sir J. D. HOOKER in his description says:—"The wonderful flexuous tail to the spadix, which I have usually found lying on the ground, is the most striking feature of this and some closely allied species. Of its use only a guess has been hazarded—that it may lead wingless insects into the spathe, and so to the stamens in one case and to the ovaries in another, and thus effect the fertilisation of the latter." The mottled petiole, the dark green leaflets conspicuously edged with blood-red, and the graceful form and fine colouring—deep glossy purple, greenish and white—of the spadix, combine to render this Sikkim Aroid a most desirable greenhouse plant.

— THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are pleased to be able to announce that H.R.H. the Duke of CONNAUGHT has consented to take the chair at the ensuing annual festival in aid of the funds of this Institution. The day is not yet fixed, but it will probably be early in July.

— PRIZES FOR ASPARAGUS.—We are informed that Sir HENRY THOMPSON has offered to add five guineas to the prizes offered by Mr. W. ROBINSON, some time ago, for improved Asparagus culture. The first competition will take place next spring at the Bath and West of England show at Tunbridge Wells, and the exhibitions will be continued during seven years, every year in a different locality. Mr. S. SPALDING has also promised five guineas, to be given as an extra prize the year the exhibition is held in Kent. It will be remembered that the Hon. and Rev. J. T. BOSCAWEN has given an extra prize of five guineas, to be competed for at the first competition. M. GODEFROY-LEBEUF, of Argenteuil, near Paris, offers the sum of £10 to be distributed in prizes. Apart from these sums, over 100 guineas will be given in prizes for the improved culture of this vegetable.

— AMORPHOPHALLUS RIVIERI, another Aroid of great beauty, is also in flower in one of the cooler compartments of the T range at Kew. Figures, with details of structure, &c., were given in our pages for 1873, pp. 610, 611. Whether in flower or leaf—for, unlike the *Arisæma*, flowers and leaves are not produced at the same time—the plant is a most striking one. The flower-stalk is olive-green, spotted with pale puce, and the inner surface of the spathe is dark, shining, reddish-purple. The spadix is dull purple, about twice as long as the spathe. In a fair specimen the umbrella-like leaf is supported by a stout petiole, 4 feet or more in height. The peculiar coloration of the leaf-stalk—a greenish-black ground bearing paler spots—affords a somewhat striking resemblance to a serpent's skin.

— ORCHIDS IN FLOWER AT FOREST FARM, WINDSOR FOREST.—The whole of those named in our number for February 7, excepting *Cœlia bella*, *Epidendrum equitans*, *Leptotes bicolor*, *Phaius maculatus*, and in addition:—

<i>Ada aurantiaca</i>	<i>Galeandra Devoniana</i>
<i>Cymbidium eburneum</i>	<i>Isochilus linearis</i>
<i>Cypripedium barbatum</i> bi-	<i>Mesospidium sanguineum</i>
florum	<i>Otomeria species</i>
" Boxalli	<i>Odontoglossum Lindleyanum</i>
" Pearcei	" odoratum
<i>Dendrobium Jamesianum</i>	<i>Oncidium Cavendishianum</i>
" lituiflorum	" Papilio
<i>Lycaste lanipes</i> : fifty-four	" Wentworthianum
flower-scapes on two pseudo-	<i>Phalænopsis Schilleriana</i>
bulbs, and several of these	<i>Sarcanthus species</i>
with two flowers on a scape	<i>Spiranthes species</i>

— CYPELLA CÆRULEA.—This fine Irid, which was figured in a recent volume of the *Botanical Magazine*, fully deserves all that Sir JOSEPH HOOKER writes of it. In the letterpress accompanying the figure he says, "A magnificent plant, a native of the Brazils, long known in our gardens, though displaced of late by newer but far less attractive favourites. Whether for the boldness of its distichous sword-like foliage, or the magnificence of its fine Iris-like flowers, it is well worthy of a permanent place in our stoves." The bright green leaves are 3 feet or more long by an inch broad, and the full-sized blossoms measured 4 inches in diameter. The outer perianth leaves are broadly oblong, the blade being blue and the claw

yellowish with transverse brown bands; the inner segments are only half the length of the outer ones, the limb being a much deeper blue, and the claw marked with orange radiating bands. It is a plant of easy cultivation, merely requiring ordinary stove treatment.

— ORCHIDS IN FLOWER. — The following Orchids are now in flower at the Victoria and Paradise Nurseries, Upper Holloway:—

Angracum citratum	Dendrobium primulinum
"  sesquipedale	"  tortile roseum
Calanthe nivalis	"  Wardianum, several fine plants.
"  Turneri	
Cattleya amethystoglossa,	Epilobium bicoloratum
"  several plants	"  Lælia anceps grandiflora,
"  Thompsoni	"  splendid plant
"  Trianæ	"  albida
"  pulcherrima	"  flava
"  Wasscewiczii delicata	"  harophylla
"  "  rosea	Leptotes bicolor
Cœlogyne cristata, about thirty	Lycaste Skinneri
"  plants of this charming	"  "  delicatissima
"  Orchid	"  "  purpurata
"  ocellata maxima, twenty-	"  "  gloriosa, and many
"  four spikes, 105	"  "  other varieties
"  flowers	Masdevallia polysticta
Cymbidium eburneum	Odontoglossum Alexandræ,
"  ensifolium	"  some splendid varieties
Cypripedium barbatum	"  "  cirrosuum
"  Boxalli	"  "  cristatum
"  Crossii	"  "  gloriosum
"  Dayanum	"  "  Hallii
"  Dominianum	"  "  Lindleyanum
"  Koezii	"  "  nebulosum
"  villosum, magnificent	"  "  Pescatorei

"  "  Pierardi	"  Vanda tricolor superba

— HARDINESS OF MINORCAN PLANTS. — The Rev. H. HARPUR-CREWE writes:—"I fear many of the interesting plants of this island will not be able to stand the rigours of our English winters when they come upon us with the severity which has characterised the one through which we have just passed. The following species, which I brought home with me last spring, appear to be quite dead:—

- Digitalis dubia* completely killed, both in a cold frame and the open border. I have, however, a few seedlings coming up in the greenhouse.
- Ononis crispa*.—I fortunately succeeded in striking two cuttings in the autumn, and have kept them alive in the greenhouse.
- Clematis balcarica*. [With us this plant is only slightly injured.]
- Pastinaca lucida*.—I brought home several seedlings of this handsome foliaged plant, and before the frost came they had grown into large strong plants, but they appear to be killed to the very tips of the roots.
- Cœorum tricoccum*.
- Scrophularia canina*."

— ORCHIDS IN FLOWER AT BRENTHAM PARK, STIRLING.—The following Orchids are now in flower in Mr. SMITH'S collection at Brentham Park, Stirling:—

Ada aurantiaca	Lycaste Skinneri, several
Calanthe vestita nivalis	Masdevallia bella
Cattleya Trianæ	"  "  igneæ rubescens
"  Wasscewiczii alba	"  "  polysticta
Cœlogyne ocellata maxima	Odontoglossum Alexandræ
Cymbidium eburneum	"  Anderssonianum
Dendrobium Ainsworthii	"  "  cirrosuum
"  "  ceruleum	"  "  cordatum, several
"  "  crassinode	"  "  cristatum
"  "  Barberianum	"  "  Pescatorei
"  "  Devonianum	"  "  Rossii majus
"  "  Farmerii	Oncidium ampliatum

"  "  Wallichii	"  "  Sophronitis coccinea
"  "  Wardianum, several	"  "  grandiflora
Dendrobium glumaceum	"  "  violaceo
Lælia anceps	

— THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 17th instant, at 7 P.M., the following papers will be read:—"Thermometric Observations on board the Cunard R.M.S.S. *Algeria*." By Captain WILLIAM WATSON, F.M.S. "On the Greenwich

Sunshine Records 1876-80." By WILLIAM ELLIS, F.R.A.S., F.M.S. "On the Rate at which Barometric Changes Traverse the British Isles." By G. M. WHIPPLE, B.Sc., F.R.A.S., F.M.S. At 8 P.M. the discussion on the papers will be suspended, in order to afford the Fellows and their friends an opportunity of inspecting such instruments as have been sent in for exhibition.

— LEEDS HORTICULTURAL SOCIETY.—This society, which holds its exhibition on June 23 and two following days, has again issued a liberal schedule, the most noticeable feature in which is three classes for plants effectively grouped, the principal one (open) confined to a space of 300 square feet, with prizes of £15, £10, £5; the other two restricted to amateurs resident in Yorkshire, the Mayor giving a timepiece value £10 as 1st prize in the largest of these amateur classes. The local authorities in Leeds have always supported the Society in a way worthy of imitation, but too often wanting in other places.

— WAKEFIELD HORTICULTURAL SOCIETY.—The eleventh annual exhibition of this Society will be held in the Grammar School Ground, on Friday and Saturday, August 13 and 14.

— RICHMOND HORTICULTURAL SOCIETY.—The sixth annual summer exhibition of plants, flowers, fruit, &c., of the above Society will be held in the Old Deer Park, Richmond, on Thursday, July 1.

— CROYDON HORTICULTURAL SOCIETY.—The thirteenth annual exhibition of this Society will be held in the grounds of Wellesley House, on Wednesday, June 30.

— RAMSGATE AND ST. LAWRENCE HORTICULTURAL SOCIETY.—August 11 is the date selected for holding this Society's annual show.

— TIVERTON HORTICULTURAL SOCIETY.—The annual exhibition will take place on Thursday, July 1; and the Devon and Exeter Bee-keepers' Association will hold an exhibition of bees and necessary appliances in connection with it.

— COVENTRY AND WARWICKSHIRE FLORAL AND HORTICULTURAL SOCIETY.—The annual exhibition of this Society is fixed for Monday, July 12, in the grounds of Stoneleigh Abbey.

— THE WEATHER.—General remarks on the weather during the week ending March 8, issued by the Meteorological Office, London:—The weather was dull, rainy, and unsettled at first, but subsequently improving, the sky clearing at intervals in most places; on the 8th the weather was fine and bright in nearly all parts of the kingdom. Snow and hail showers were experienced over the north of England and in Ireland at the commencement of the period; lightning was seen in several parts of the country on the first few days, and a thunderstorm occurred at Mullaghmore during the night of the 2d. The temperature was above the mean for the time of year in all districts, as much as 5° or 6° in excess over the greater part of England, and 3° or 4° elsewhere. At many stations in Central, Eastern, and Southern England the maxima was 65°, or a little above, on the 5th, and again in some places on the 7th, while the lowest readings were registered on the 2d or 8th. The wind was between S. and W. during the first five days, and generally strong to a gale; but by the 7th it had veered to N.N.W., except in the S.E., and moderated. On the 8th it had shifted temporarily to N.E. over England, to S.E. or S. in Ireland, and to S. in Scotland, but was light to moderate in force. The rainfall was more than the mean in all districts except "Scotland, E.," where it was slightly less. The bulk of the fall took place during the first few days.

— GARDENING APPOINTMENTS.—After six years service as Gardener to G. A. EVERITT, Esq., Knowle Hall, Warwickshire, Mr. J. W. SILVER has been appointed Gardener to AYSBOUGH FAWKES, Esq., Farnley Hall, Oteley, Yorkshire; and has been succeeded at Knowle Hall by Mr. COMFORT, the late Gardener at Farnley Hall.—Mr. JAMES DAY, late Foreman to Mr. NORMAN, at Hatfield, is appointed Gardener to the Earl of GALLOWAY, Galloway House, Gartlieston, Wigtonshire:

EFFECTS OF THE FROST IN FRANCE.

THE effects of this frost may without exaggeration be considered as most disastrous both to amateurs and nurserymen, in many of whom have lost their whole stock. The degrees of temperature observed here during the month of December were the following: they are put in Fahrenheit so as to be more easily understood by readers in general, and are the lowest night temperatures registered in a rather sheltered spot:—

December, 1879: Fahrenheit.

1st, 11° above 0°	12th, 26° above 0°	22d, 10° above 0°
2d, 13° " "	13th, 5° " "	23d, 11° " "
3d, 5° " "	14th, 5° " "	24th, 3° " "
4th, 15° " "	15th, 0° " "	25th, 13° " "
5th, 10° " "	16th, 0° " "	26th, 3° " "
6th, 5° " "	17th, 2° under 0°	27th, 6° " "
7th, 2° under 0°	18th, 15° above 0°	28th, 36° " "
8th, 5° " "	19th, 8° " "	29th, 26° " "
9th, 16° " "	20th, 3° " "	30th, 37° " "
10th, 16° above 0°	21st, 8° " "	31st, 34° " "
11th, 16° " "		

In the tall Conifers the part that has suffered the most is the centre of the tree; the top seems not to have been injured at all, but unfortunately the stems are frozen. Up to the present time we may consider as lost—and, in fact, in most parts they are already cut down—the following:—Laurels, all sorts; Privets, Aucubas, Magnolias, Rhododendrons, some sorts; Hollies, Ivy, Glycine, Ampelopsis Veitchii, standard Roses, of course—the Briers themselves are frozen; dwarf Roses were to a certain extent protected by the heavy fall of snow lying on them at the time. Some of the most remarkable trees we know of as being lost are Cedrus Deodara, 2.80 metres round the stem, 20 m. high; Chêne Vert (Quercus Ilex), 80 centimetres round stem, 15 m. high; Magnolias of 60 cm. round stems and 6 m. high; bushes of the Caucasian Laurel 3 m. high and 4 m. diameter; Cedrus Libani, several of 3 m. round stem, and 25 m. high; Araucaria imbricata, 75 cm. of stem, and 12 to 15 m. high; Wellingtonia gigantea, 4 m. round stem, and 16 to 18 m. high. The fine old Cedrus Libani, planted in the Jardin des Plantes some 150 years ago, has also fallen a prey to the severe winter. We can, therefore, safely assert that such a heavy frost has not occurred in France for at least 150 years. Great are the complaints received from nurserymen, even from Angers, Lyons, and other parts. The common Taxus baccata has suffered much, and we are afraid many more trees will have to be cut which we have not yet noticed. The Box tree has resisted pretty well, though in some parts the tips are frozen. Mahonias have also suffered. Horse Chestnut trees have cracked from the branches downwards; it remains to be seen whether this will kill them or not. Thuja gigantea, Cryptomeria elegans, and Taxodium sempervirens are lost. Taxodium distichum has suffered much, and also Cupressus Lawsoniana, Pinus excelsa, Abies Pinsapo, and Abies Nordmanniana. The Bamboos of all sorts are frozen. A very curious thing was noticed by us the other day amongst standard Roses. Persian Yellow grafted on Briers are not frozen, while the Briers themselves on which they are grafted are lost. It shows that Persian Yellow is a very robust Rose; we noticed the same fact with some Moss Roses. The well known Vines of Thomery, near Fontainebleau, are lost, and of course all the outside Vines. In the houses where no fire was kept the Vines seem to have suffered a little. Most of the fruit trees are lost, especially Apple trees, Pear trees, Walnut trees, &c.: the old wood looks more frozen than the young. In the woods Quercus rubra and the common Oak have suffered heavily, as well as the Chestnuts (Castanea). It now remains to be seen what will be the effect of the sun on many other trees and shrubs that for the present seem right enough. Trees which after the heavy frost were thought uninjured are now found to be so, and we are afraid we shall have still more to note down than those above-mentioned. We hear of many nurserymen and amateurs going to England to buy, on purpose to replant their nurseries or their pleasure-grounds; so that if the frost has done a great deal of harm in France it will to a certain extent improve the horticultural trade in England, and allow English nurserymen to sell their stock at a good profit. It seems curious, though, to hear of French rosarians going to London to buy Rose trees, so therefore we are safe again in quoting the old French proverb—*A quelque chose malheur est bon*.—E. B.

\* Heavy snowstorm in the night, half a yard of snow on the ground.

## Home Correspondence.

**Begonia Comte de Limminghe.**—Allow me to say a word in favour of the above evergreen Begonia, which I think would be more frequently grown for winter and spring decoration if better known. Cuttings put in now, singly, in small pots, and plunged in a little bottom-heat, will soon be fit for potting on into 5 or 6-inch pots—a size in which they will make nice plants about 2 feet high and 15 inches through by the end of summer. A few stakes are required to train them round, the plant being of a pendulous habit. Keep in a cool light house through the autumn, and introduce to the stove or intermediate-house in December, and in five or six weeks a nicely bloomed plant will be the result. The flowers are also very useful in a cut state, keeping fresh quite a fortnight in water. *Chas. Herrin, Chalfont Park.* [The profuse cymes of waxy salmon-coloured pale-edged blossoms are very attractive when grown like those you have sent. Eds.]

**Eremurus turkestanicus.**—In last week's *Gardeners' Chronicle* I see this plant alluded to; and, as there seems to be a doubt of its hardiness in this country, I write to say that it has stood without injury the last two winters and summer in my garden, while *E. robustus*, which I believed equally hardy, has not yet appeared above-ground, and I am afraid is dead. I do not attribute this to the cold, but to the wet of last summer, and think that if I had taken the plant up, and kept it dry till November, it would have lived. It is hardly correct to describe the roots of *Eremurus* as bulbs. They consist of a stout fleshy crown, surrounded by thick perennial roots, radiating like the spokes of a wheel. As soon as the plant has died down, and the fibres produced by these thick roots have dried up, the plants may be safely lifted and kept dry for three or four months, as being natives of Central Asia they do not like moisture in summer. *H. J. Elwes.*

**Tropeolums as Bedding Plants.**—The utility of having a sprinkling of showy flowering plants propagated for bedding purposes was strongly exemplified last year when the continuous rainfall was so great that flowers of tender fabric were no sooner open than they were partially drowned out by a sudden downpour of wet. Amongst some of the flowering plants that I noticed to be weather-proof were scarlet *Tropeolums*. The variety was evidently raised from seed, and was named Tom Thumb. The leaves were of a glossy dark colour, and the flowers, which were thrown up well above the leaves, were of a bright warm scarlet. The habit of the plant is everything that could be desired, being a stiff, erect little bush, which seemed to revel in wet. The plants were relegated to an obscure position, but their attractive appearance after each succeeding deluge of wet so called my attention to their usefulness that I resolved to raise a stock from cuttings, which shall have a prominent place in the flower garden this year. When we remember what a brilliant bed can be made of these lovely flowers, that are so simple to cultivate, with an edging of *Koniga maritima variegata*, still one of the showiest of dwarf edging plants, perhaps the remainder may be of service to some of your readers. I think the prettiest and most chaste effect I ever remember to have seen produced was in a chain border planted with scarlet *Tropeolums*, *Koniga variegata*, and blue *Violas*. *W. Hinds.*

**Lawn Tennis in Gardens.**—As lawn tennis is undoubtedly to be the garden game of 1880, and probably of succeeding years, it will perhaps be interesting to readers of the *Gardeners' Chronicle* to see suggestions respecting its use in ornamental grounds. A few years ago many of us added materially to the beauty of our grounds by getting our lawns as level as possible for croquet. At the present time the cry of the many is "we don't care about the lawn being so very perfect so long as it is good enough to play lawn tennis upon." Seeing then that lawn tennis is to be played on the croquet grounds, it seems to me expedient that those of us who have a tender regard for our turf should endeavour to preserve its beauty as far as the boisterous tendency of the present state of civilisation will allow. Having a splendidly level croquet ground of my own which it has been a labour of love for some years past to get nearly perfect, I did not like the idea of having it torn up by tent-pegs and guy-ropes, neither did I like refusing to allow my friends the pleasure of playing lawn tennis upon it. After some thought and several experiments my object of reducing the harm done to a minimum was attained. My invention, originally made only for my own use, having been much liked by my friends, is now patented. I have found the irons that I employ for the support of the lawn tennis poles useful for several other purposes as well. I have a flagstaff about 14 feet high standing in my garden at the present time, which is only

inserted in the ground about 8 or 9 inches, and which has stood firmly for more than six months, held by one pair of these irons. The irons make no more mark on a lawn than two croquet-hoops would, and occupy about 6 inches square of space. I believe this simple and effective plan of supporting poles is applicable to various horticultural purposes, such as enclosing fruit trees temporarily with garden netting, protecting wall trees, &c. Last summer, having erected one of Benjamin Edgington's hexagon tents, I found only one fault in this admirable little garden parlour. A gusty wind caused the tent to rock a little, as the pole in the centre, to which a table is attached, merely rests on the ground. There was sufficient oscillation to spill the contents of teacups or glasses, but by supporting the pole with a pair of the lawn tennis irons, which exactly fitted the pole, the structure stood firmly in a stiff breeze. The advantages of the lawn-tennis standards are as follows:—1. They do not injure the most perfect croquet

FIG. 60.—STANDARD FOR LAWN-TENNIS NET.

lawn. 2. They can be easily and quickly set up. 3. The net can be removed in two minutes at the end of the play, thus leaving nothing out that can be injured by weather. It can be as quickly replaced. 4. There are no guy-ropes to fall over or occupy space. 5. The poles can be set within a very few inches of a flower-bed or gravel path. 6. The ground can be rolled without removing poles or irons. 7. Grounds too small for lawn tennis where guy-ropes are used can be turned to good account for the game by using the standards. For setting up the poles, make a hole in the ground 8 inches deep with an ordinary piece of pointed wood the size of the pole. In this hole place one of the poles, pressing it firmly and perpendicularly into its place. See that the brass buttons on the pole are towards the end of the court. There are

FIG. 61.—LAWN-TENNIS NET.

two irons with a flat top, and two with a bent shoulder: one of each constitutes a pair. Take one of the level-topped irons, and drive it with a wooden mallet about 6 inches into the ground, slightly slanting in the direction of the pole, so as to support the latter on one side. The corresponding iron (one of those with the bent shoulder) may then be similarly driven into the ground so as to support the pole on the other side. The object of the upper iron having the bent shoulder is to form a level top for the reception of the wedges. The irons thus placed will form a double loop or cage round the poles. Now take a pair of chained wedges, and having brought them over the top of the pole, slide them down to the shoulders of the irons. Drive the wedges in between the shoulders of the irons evenly. The wedges tighten the grip on the pole and each other. The intention is that one shoulder of each separate iron should be towards the net. To illustrate my meaning imagine a straight line drawn in continuation of the net at each end—the supposed line would pass through the tops of all the four wedges (not between them), and would be parallel with the brass chains that connect the wedges.

The other pole having been similarly placed, the net has simply to be hooked on to the brasses and adjusted by means of the knotted cord to the required height. The lower corners of the net are merely tied to one leg of the irons. The nets, supplied by Benjamin Edgington, London Bridge, with the irons, are not intended to touch the ground, as most players like to be able to pass the balls under the net to save trouble at the end of the service. The wheel action which I am about to describe, although not essential, is admitted by all who have seen it to be a great improvement, as it keeps the net exactly at the required height without allowing it to get slack. By looking at the woodcut representing the single pole (fig. 60), two revolving grooved wheels will be noticed. These are screwed on to the pole, and about 6 inches below each of the wheels is a small brass knob or button. The use of these wheels and knobs will be perhaps better seen in the diagram of the net set up ready for use (fig. 61). A round india-rubber door-spring, fastened to one of the top corners of the net, is strained over one of the wheels and looped on to the brass knob below, by means of a double knotted cord. A strong string attached to the top cord of the net, and pegged to the ground in the centre of the court with a staple, keeps the top of the net from rising to more than 3 feet high in the middle. The net is then drawn up tight by looping the knotted cord (at the end of the net where there is no india-rubber) tightly to the brass knobs on the pole. The india-rubber thus being brought into action keeps the net exactly up to the height of the check string, which is, of course, 3 feet. The only object of having two wheels on one of the poles is that the height of the net at the ends may be altered, if required, for single or double-handed play. In both of the diagrams the position of the wedges is shown before they are driven into their places between the shoulders of the irons. *Fredk. Rayment Matthews, Ovesham Tye.*

**Mentha Pulegium gibraltarica.**—A more expeditious plan of increasing the stock of this plant than Mr. Wildsmith's (p. 311), is to place the plants in a temperature of 70° and propagate it the same as *Verbenas*, by which means it strikes very freely. When you have enough, plant it out in nursery beds previous to putting it into its summer quarters. I once raised several hundred from a small plant that was not more than an inch in diameter in January, and by the end of May they were quite large enough to plant out. *A. Waterman, The Gardens, Preston Hall, Aylesford.*

**Fritillaria oranensis** (fig 62).—This handsome Fritillary was shown by Mr. Wm. Bull at the last meeting of the Floral Committee, but, for some reason or other, it received no award. It is, as we learn from Mr. Baker, the same species as that named by him *F. Munbyi* in our columns, 1877, vii., p. 45. The earlier name of *oranensis* must, however, be adopted for it. The cylindrical bell-shaped flower is about 1½ inch in length, the segments purplish-brown with a broad central stripe of pale yellowish-green and a narrower edge of the same colour. For a full description of this striking novelty we refer to Mr. Baker's description above quoted.

**Pointing Old Walls.**—I can sympathise with Mr. J. Horsefield in the mischief he has had to contend with and the carelessness of the men in pointing the joints of the walls he has charge of, having suffered in the same way myself when first having ours done, but since then I am particular in having the work done by one I can trust to do it well without injuring the trees. This can be done very easily if the branches are laid together in bundles and tied up close in that way, and then looped or supported to stout stakes, so that they can be moved when necessary a little out of the way. Where wiring of walls has to be done, it would be a great mistake not to thoroughly point the walls first, as it is not so much a question of getting rid of insects as the keeping of wet out and the preservation of the bricks, which decay at a great rate and become mossy if damp; and not only this, but a dry wall is considerably warmer than a wet one, the latter of which attracts the frost, and is therefore bad for the blossoms. The way we manage here is to stop neatly and thoroughly by first mixing soot and mortar, and adding a little Portland cement to it after, measuring the latter each time, so as to have all dry the same shade of colour. Autumn is the proper time for the work, as then there is not so much danger of hurting the trees or the buds as there is when these latter are swelling fast, as they are in the spring. *J. S.*

**The Culture of Lachenalias.**—I have grown *L. quadricolor* in various temperatures, ranging from 40° to 70°, and have always found them succeed best at 40° to 50° in a moderately damp atmosphere close to the glass, such as a pit with a bed of coal-ashes to stand them on. I have known them survive a mild winter outside in a sheltered position, but the flowers

generally proved very few and of inferior quality. The finest I ever saw were grown in pans 4 inches deep, in a cold pit from which the frost was barely excluded, and were potted in good loam with a liberal supply of sand and charcoal, and a little leaf soil, and were well fed with liquid manure, of which they will take a liberal supply before the flowers open. A well-grown pan of *Lachenalias*, containing from twenty to thirty bulbs, well repays a little extra care in their culture. As regards the other varieties, my experience with them has not been extensive enough to warrant me in giving any details of culture. *W. H. Divers, Burghley.*

— I find the best way to manage *Lachenalias* is to grow them in baskets. I have some at the present time quite 3 feet through, and one mass of bloom. I make these baskets up about October, placing the bulbs in layers round the outside, using a little sphagnum to keep in the soil. I hang them in a Fern-house for the winter, where they make foliage 2 feet long. The flower-spikes begin to show early in the year, and with the long spotted foliage hanging down, and the flowers pointing upwards, they look

fresh root-action is established. By the time this is accomplished there will be another batch of young cuttings ready to be cut from these plants, and in this way the whole stock may be raised from healthy young cuttings. The little root-space that we can afford to allow many bedding plants that are propagated early is nothing short of starvation long before they are planted out, by which time growth is temporarily "pumped out," and a considerable time elapses before healthy growth takes place afresh, unless the weather is very favourable at planting time. I think later propagation for many plants, and a more generous system of cultivation, would be a great benefit, and would give an earlier display. What say some of our experienced flower gardeners? *W. Hinds.*

**Coprosma Baueriana variegata as a Bedding Plant.**—This is one of the most beautiful bedding plants that we possess, and is sometimes employed in carpet-bedding with exceedingly good effect. It is, however, more frequently seen as a dwarf greenhouse shrub (and a pretty one it is, too) than as a bedding

far exceeding any spring Cabbage, however succulent and tender it may be. *Couve Tronchuda*, too, comes in at a time when common Cabbages are comparatively worthless, that is, during the autumn, when they are most valuable for filling a gap, as it were, in the supply, and affording variety after the flush of Peas and other summer crops is over. To have it in first-class condition at that season seed should be got in at once, and if under the protection of glass all the better, as the great thing in the successful cultivation of *Couve Tronchuda* is to raise and start the plants early, that they may have a long period before them to complete their growth and enable them to turn in with fine hearts. Instead of getting into this desirable condition when sown late they run a good deal to leaf and remain loose, and are therefore not half so tender and serviceable for cooking, although the midribs are even then prized by many, and are considered an excellent substitute for *Sca-kale*. To use these and lose the other part, however, is great waste, and like throwing away the meat for the sake of picking the bone, the stems being of a coarser nature on account of the fibre they contain and the length of time they are in reaching their full size. Like all of the same family the *Couve Tronchuda* is a very gross feeder, and should be afforded a rich piece of ground well prepared by being deeply dug or trenched, and at the same time heavily manured, keeping the latter low down that the plants may have something to lay hold of and attract the roots below to save them from suffering from drought during dry weather. In planting I find it is a good plan to draw deep drills like those made for sowing Peas, especially in all cases where the soil is light, as should they require water or sewage during their early stages it can then be easily given, and any hoeing the ground may receive after for the purpose of destroying weeds gradually fills in the small furrows, and thus lands up the stems and keeps the plants steady. The distance at which these should be placed apart is about 2 feet each way, and in transferring them from the seed-bed it is important that they be lifted with large balls and got out to their permanent quarters before they become drawn, to prevent which it is advisable to prick out or sow very thinly, as plants with culminated stems never do anything like so well as those that are stocky and dwarf. *J. S.*

**Rapid Rise of the Sap.**—I do not know if any of your readers may have witnessed what I have these last few days. I have a number of Vines which made an inch of growth without showing any trace of bleeding, but since the mild weather has set in I find the greater part have commenced to bleed. I do not suppose this will do them any material harm, but is it not unusual? *J. C.*

**Amaryllis Ackermanni pulcherrima.**—This beautiful bulb has stood the late severe winter in the open border without the slightest injury. I saw a long conservatory border in Derbyshire, the other day, completely filled with it. The bulbs were simply covered with a little dry Fern. They were coming up when I saw them a fortnight since as strong as *Daffodils*. *H. Harpur-Crewe, Drayton-Beauchamp Rectory, Tring.*

**Pentstemons.**—Whilst nearly all the *Pentstemons* of the *gentianoides* race in the open ground have died from the effects of the frost I notice that a number of plants of a species that has long broad lanceolate leaves that remain fresh and unhurt all through the winter are all alive and already throwing up flowering shoots. As a leaf perennial alone this species is most valuable for the garden border, but its flowers are not effective when contrasted with the florists' kinds. Having regard to the fine hardy features it displays as compared with the tendency to perish by frost shown in the *gentianoides* group, it is worth the attention of hybridists to try how far they can engraft the fine flowers of the one on to the hardy habit of the other. *A. D.*

**Sea Sand.**—I have found that all soft-wooded plants strike freely in sea-sand, and when mixed with soil for potting the plants have done well in it. We used to get it from the sand-hills close by the sea-shore, so that all the salt would be washed from the sand before it is used: it is very fine, and must be used freely. It is good for gardens where the soil is stiff and bad to work, and seeds germinate freely in it. *H. Little, The Gardens, Rusland Hall.*

**Violet odoratissima, with Hints on its Culture.**—This is a splendid Violet—I think the best of the single blue kinds. The plant is of dwarf robust growth; the flowers, which are very sweet-scented, and produced in great profusion, have broad petals, and are of fine form. All who love Violets (and who does not?) should grow it. It is a very hardy sort. In illustration of this, I have a quantity of strong plants of it and *Victoria Regina* growing together without any protection all the winter on a cold north border. The last-named sort

FIG. 62.—FRITILLARIA ORANENSIS. (SEE P. 340.)

very graceful. As soon as the flowering is over they are placed under the greenhouse stage, watered for a few weeks, and then allowed to become quite dry, when they are shaken out. I get from four to six good bulbs from one, and a quantity of small ones. The sort I grow is *L. tricolor*. *J. C.*

**Propagating Alternantheras.**—These, the most lovely plants that we possess for carpet-bedding, although easily propagated by division or from cuttings, succeed best when propagating is not taken in hand too early in the season. They also enjoy heat and moisture, and a rich open soil to grow in. I noticed last year that plants that were raised by division did not grow so freely as those that were raised from cuttings. I think we are often in too great haste in propagating plants for the flower garden—no doubt from anxiety to get through the work in good time. The most successful way of treating *Alternantheras* at this season is to trim the old plants back a little, and then put them on a warm hotbed, where there is a gentle steam from fermenting dung and leaves. Under these conditions they soon break away and produce fine young cuttings, which root freely in a few days in a mixture of leaf-mould and sand. They should then be boxed off into a rich open soil, and returned to the hotbed until

plant. The first place I ever saw it used in carpet-beds was in Prince's Park, near Liverpool (and I think a description of it will be found in the columns of the *Gardeners' Chronicle*, in a report of mine which appeared two or three years ago), where Mr. Mason displays marked ability every year in the variety of arrangement, and the originality of character, which is exemplified in his designs for carpet-beds. The plant is of a semi-hardy character, and should be put into heat for some time before cuttings are taken, in order to render the young shoots more susceptible to the influence of warmth. The cuttings root freely in shallow pots or pans, in a mixture of about equal proportions of leaf-soil and sand, and should then be potted off into small pots. The leaves of the *Coprosma* are very compactly arranged, with a broad zone of bright yellow round the outside of the leaf. It should be planted in a situation where it will be exposed to the sun, and in a soil that is rather light and porous, in order to bring out the true markings of the leaf. *W. Hinds.*

**Couve Tronchuda.**—Now that the season has again come round for sowing most of the *Brassica* tribe, I wish to call attention to the merits of *Couve Tronchuda*, as unquestionably it is one of the most delicious vegetables grown, in flavour and delicacy

lost nearly all its leaves, while *odoratissima* had scarcely a leaf injured, and began to flower earlier. I find that for late winter and spring blooming in frames, decidedly the best results are obtained by striking a quantity of runners (selecting those with a tendency to form a crown or plump bud at the end) in cold frames, the cuttings to be inserted 2, 3, or 4 inches apart, and 6 or 8 inches from the glass. I put in two or three successive batches from July onwards. The earlier and stronger cuttings of course require more room than the later or smaller ones. They should be freely exposed when rooted, and should not be disturbed till after the blooming season is over, unless a bed of leaves or leaves and dung is available, when they may be replanted closely together, and close to the glass towards the end of October. With the gentle bottom-heat so produced, they as a natural result bloom earlier, and in severe weather more freely. I have cold frames of cuttings treated as first advised, which are, and have been, a sheet of bloom. The same space filled with large clumps grown in the ordinary way would not throw off more than two-thirds the quantity of flowers. For autumn and early winter flowering, divisions of old plants, or, better still, cuttings of the previous autumn, planted 15 or 18 inches apart in free rich soil, in a north border at the end of March, or early in April, and well attended to with water in dry weather, are better than younger plants, as the bloom-buds form earlier and are ripened sooner. All runners, except those required for cuttings, should be pinched closely off as they grow. These remarks apply to such sorts as *odoratissima*, *Victoria Regina*, and the *Czar*. The latter sort I discarded some years ago in favour of *Victoria Regina*, as being far superior, and it again will, to a great extent, have to give way to *odoratissima*. *Viola*.

**Early Flowers.**—As I see you are noticing the appearance of wild flowers, the following may interest you. In my children's garden on a bank with western exposure the first Primrose was pulled on February 2, the first Violet on the 16th. I pulled a Cowslip on February 27; to-day I have several Cowslips in bud on my lawn. Lilac and white Crocus appeared in flower yesterday. I heard the first blackbird on February 5, and the first thrush on February 10. *J. A. Craxford, Northfield, Annan.*

**The Functions of Roots.**—Can any of your readers inform me if the roots of a plant are of two kinds—one to supply nourishment to the leaves, and another to the flowers? It seems quite possible that there should be roots of different characteristics, in the same manner as there are male and female blossoms on the same plant. I have been led to make this observation by watching a Hyacinth bulb grown in a glass with water. It was shut up at first in a dark cupboard, but the severe cold affected the plant very much. It was a long time before it grew, and then it threw out a single root, which developed speedily and well, but no other roots were developed, and the bulb was fed by this root alone; eventually a blossom appeared, white and perfect, but the plant has never had any development of leaves. I shall be glad if any of your readers more versed in botany than myself can throw any light upon this subject. *Cyril*. [The root in question may have supplied water to the bulb, but the flowers were nourished almost entirely from the food stored up in the bulb itself. This store was large enough to supply the wants of the flower, whose germ was laid last summer in the bulb, but not sufficient to supply the requirements of leaves principally formed this spring. EDS.]

## Florists' Flowers.

**THE QUILLED ASTER AS AN EXHIBITION FLOWER.**—The Aster long since vindicated its right to be classed with the florists' flowers. It was grown for show purposes fifty years or more ago. Not that a particular flower can be said to be introduced to the enjoyment of any special advantages because it is put into this category, for that does not operate in any degree. "Florists' flowers" can and should be taken as comprehending any subject, whether it may be grown and shown in pots, as in the case of the *Auricula* or *Cineraria*, or cultivated for its cut blooms as exhibition subjects, as in the case of the *Tulip*, *Chrysanthemum*, or *Gladiolus*. In course of time some may fall away from general cultivation as exhibition subjects, as in the case of the *Pansy* and the *Anemone* and the *Ranunculus*; or fresh subjects may come to the fore, as in the case of the *Gladiolus* in recent years. The term "Florists' flowers" must needs be a comprehensive and elastic one, especially as at one time certain subjects receive greater or less attention than at another.

The Aster has of late years at least become a leading exhibition flower. There is scarcely an exhibition

held during August and September whose schedule of prizes does not include Asters. They are so well grown and exhibited in some districts as to possess in a remarkable degree the particular characteristics which exemplify comparative perfection in florists' flowers—size, symmetry, purity, colour, beauty, and attractiveness. We have seen Truffaut's Peony-flowered, the splendid *Victoria* type, and the delicate quilled Asters shown in such fine condition as to leave but little to be desired, though they have not yet reached forward to the possession of that unknown quality of perfection laid up ahead in the pathway of the floral progression. It is profoundly true of the florist that he walks more by faith than by sight, but what he is privileged to see whets the appetite for that which, though he may perceive it by the inward eye of faith, is not as yet revealed to him in its material form. Tennyson sings that "knowledge is of things we see," but the inspirations of trust are as a beam in the darkness that shall grow more and more till it ripens into knowledge, fact, and reverence.

Of all the Asters suited for the exhibition table, the quilled varieties are the most beautiful when presented in becoming form. When displayed of high class quality they are so delicate in tone, pure in expression, and faultless in outline, as to charm every one who has an eye to perceive the beautiful. Their grace forbids any aspect of lumpiness; their refinement any expression of coarseness.

There is this peculiarity about the quilled Aster, that those who have set themselves to the task of improving it have created a list of varieties of so much value, that they have been named, and in not a few instances received First-class Certificates of Merit. Should it be required of any flower that ere it can rank among the special subjects for which the florist has a particular *penchant*, it must have produced recognised named varieties, the quilled Aster is there, well deserving of initiation into this honourable order. Among others, Mr. James Betteridge, of Chipping Norton, the representative of a family whose name has for many years been honourably and successfully associated with the improvement of the Aster, has raised some beautiful forms, that it is said come very true from seeds. As this is the only way by which a particular variety of the Aster can be cultivated, it is well that it is so. These named varieties are divided into two groups, viz., the self-coloured and the parti-coloured or fancy flowers; the last being a convenient term without any particularly definite meaning, but useful as comprehending types incapable of special and present classification. Of the self-coloured flowers we can mention *Snowball*, *Purple Prince*, *Princess Alice*, and *Duke of Connaught*; and of the parti-coloured flowers, *Princess Alexandra*, *Princess Royal*, *Oxonian*, *Unique*, *Blushing Bride*, *Bridegroom*, and *Prince Alfred Victor*—most, if not all of them, of Mr. Betteridge's raising.

Mr. James M. Gilkes, of Wickham, Newbury, a very successful amateur cultivator of the quilled Aster informs us that he sows his seed about the middle of April in pans, using a rich soil largely composed of leaf-mould and silver-sand. The seeds are sown as thinly as possible, in order to give room for them to develop into plants, and to prevent unnecessary crowding. The pans of seed are placed in a cold frame, and the lights are kept close till the seedlings appear. When the young plants are through the soil great care is necessary in watering, and an abundance of air on all favourable occasions is necessary, or the plants are liable to damp off. When they show their rough leaves, which will be within a fortnight or so of the time of sowing, the plants need to be pricked off into other pans or shallow boxes in good soil, planting them about 2 inches apart. At this stage the plants are well exposed by day, but covered at night, as spring frosts are apt to do them injury. In the absence of a frame in which to place the plants the boxes may be stood out in the open air, but raised a little from the ground, and at night covered securely by placing boards at the sides, and throwing a mat over the plants. Care is necessary to keep the plants from becoming drawn, and if necessary to be covered by night they should be freely exposed by day in order that a short-jointed and robust growth be encouraged.

It is obvious that fine blooms of Asters can be obtained only from thoroughly good soil. Many cultivators of Asters for ordinary garden purposes appear to think that any soil will do for the plants, and starved flowers result, and blame is laid at the door of the strain. Mr. Gilkes puts his plants out in

the richest soil he has, which, when it is obtainable, he manures with pig-dung, the best of all raw manure for Asters. It imparts size and finish to the blooms beyond all other fertilisers. The bed being prepared, the plants are put out into it as soon as they show signs of throwing up a stem, and there planted in lines 20 inches apart, the plants 12 inches apart in the lines. Being carefully planted with balls of soil attached to the roots they soon make growth, and then a stake is placed against each plant to make it secure. The quilled Asters that are grown for show purposes are all of tall growth, and this is increased when planted in rich ground. Mr. Gilkes uses stakes sufficiently long to be 3 feet out of the ground when thrust into the soil, and to these the plants are carefully secured, and tied as they attain size to keep them from injury. When staking is completed the soil about the plants is carefully pricked over and a tablespoonful of Amies' chemical manure given to each plant, which is gently stirred into the soil by means of a small-pronged hand-fork or trowel, care being taken that the roots, which lie very near the surface, be not disturbed. By-and-by, when the buds swell and show colour, shading is necessary to preserve them pure; a covering of light canvas stretched across the bed, but so placed as that light and air can be freely admitted at the sides, is the best shading that can be employed. One main object in doing this is that the blooms should develop gradually, taking on the qualities that constitute perfection as they age. Some persons place an inverted flower-pot or a wooden cover over the blooms, but this kind of shading is too heavy, and is apt to impart a dull and washed-out appearance to the flowers.

Any one desirous of having a bed of high-class quilled Asters should preserve seed of some of the fine varieties named, or a packet of good mixed seed will be certain to yield some flowers of a very pleasing character. Those who grow for exhibition save their own seed from the best flowers, and by doing this secure fine show subjects, and at the same time acquire new varieties. They are obtained somewhat slowly, but the chance of originating one or two at least is open to all who are engaged in the work of improvement by raising seedlings. Mr. Gilkes states that he finds no difficulty in having an abundance of flowers from the first week in August till the middle of November—that is, nearly four months. As a matter of course the flowers had in October and November depend much on the state of the weather. *R. D.*

**THE GLADIOLUS.**—The history of many of our florists' flowers is involved in considerable obscurity, even those that have been most recently improved by cultivation probably cannot be traced to the first break from the specific form. The most beautiful forms of the *Gladiolus* are stated to be hybrids of *gandavensis*. The question arises, Are they hybrids, or merely improved varieties of this species? If they are hybrids, which is the pollen-bearer, and which the seed-bearing parent? If, as is probable, they are merely improved varieties, why use the word hybrid at all? The *Gladiolus* is one of the easiest of plants to hybridise, but I much question whether any good results can be obtained by crossing any of the improved forms of *G. gandavensis* with other hardy species. To do this would throw the strains back for many generations; and the only justification of any attempts of this kind would be the probability of obtaining hardier varieties, which might be again improved through successive generations.

Dean Herbert was a very ardent admirer of the *Gladiolus*, and grew many different varieties and species in his garden at Spofforth. The soil of his garden was light yellowish loam, and it is in such soil as this that the *Gladiolus* flourishes best. He also cultivated it in made beds of sandy peat, where it also did well, but of course required larger supplies of water. Here is a hint that the *Gladiolus* may be planted in *Rhododendron* beds, with *Lilies*, *Cypripedium spectabile*, &c. It may be interesting to quote the Dean's own words from his book on the *Amaryllids*. The "crosses are between *G. cardinalis*, *blandus*, *inflatus*, *angustus*, and *tristis*; and they vary with every shade of colour, from white to scarlet, rose, coppery, and blackish purple; and some are exquisitely speckled in consequence of the cross with *tristis*. They succeed best when grown into a thick tuft, in which state the profusion of bloom is admirable, the cluster of bulbs, and the old skins of decayed bulbs, permitting the wet to drain

away, and preventing the earth from lying too close and heavy on the bulbs in autumn and winter. Clusters have stood undisturbed at Spofforth above ten years, with the precaution of covering them with leaves from November to March or April."

The same earnest cultivator raised beautiful crosses from *G. hirsutus*, *recurvus*, and *versicolor*; but these were delicate plants, and did not succeed in the open borders. The early flowering varieties ought to be taken up and improved by those who have time and opportunity to attend to them. Some of the varieties of *Colvillii* are very pretty. The pure white variety, named *The Bride*, is exquisite for cutting, and many varieties of *ramosus* may be further improved.

The culture of these hardy varieties is very simple; they require good deep light loam, moderately rich, to start with, and it is evident that they would also thrive in peat beds. A slight protection might be afforded them in winter, and they would give but little trouble in return for a wealth of their beautiful spikes for years in succession.

It may be as well just to give a hint to would-be cultivators as to the best method of propagating them. It may be necessary to dig up the clumps for purposes of propagation, but it is best to do this in April; if it is done in the autumn, and the bulbs are planted at once, many will die during the winter. A good plan is to lift them in the autumn, and pot the bulbs, placing them under glass to be planted out about the end of April. Although these remarks have been made with special reference to the early flowering *Gladiolus*, there is no intention whatever to disparage the later flowering species and varieties, such as *G. Boviensis*, *brunchleyensis*, *floribundus*, and the very beautiful varieties of *G. gandavensis*. Rather would I like to see the early flowering sections improved by cross breeding and selection until it became equal in quality to the others. We could then have our gardens gay with *Gladioli* from early in June until late in October, and few flowers give such good results for the trouble required to grow them. *J. Douglas, Loxford.*

**PANSIES IN POTS.**—It is in April, in May, and on well-grown plants in pots that one gets flowers in all their perfection of beauty; clear in the ground, dense and regular in the blotch, with a firm, even, and richly developed belting, and with symmetry of form in combination with approved size. There is a rare gorgeousness about a fine yellow ground flower displaying these high qualities, which can be had later in the season also, but when the appetite is, as it were, blunted by feeding on other floral forms of beauty that form the wealth of summer hues. It was at the beginning of February that those who formerly made a practice of exhibiting Pansies in pots potted their plants into those which held the plants at flowering time. They would be previously shifted in October, using a good light rich soil, and a similar compost would be brought into requisition, because the old growers held the opinion that a change of soil at such a time would act prejudicially on the plants. The larger plants were put into 8-inch, the smaller into 6-inch pots, and between the time of potting and that of blooming the great aim of the grower was to insure short-jointed and vigorous stems. We should like to see a resort to the almost forgotten practice of cultivating Pansies in pots. The plants, after the final potting, need to be kept free from suckers or young growths coming up from the base of the main branches, so as to have as much strength as possible infused into those bearing blooms. These need also to be tied out, so as to give a good shape to the plants, with one or more of the strongest stems to form a centre. As the buds from the plants are assisted by applications of liquid manure, and the first flowers should be pinched off till the whole of the stems can be had in flower altogether. For pot culture plants struck from cuttings the previous summer should be selected. It is a mistake to have the plants more than one year old. *R. D.*

**ENSILAGE.**—The following very curious system of storing green fodder is of Hungarian origin, and was introduced to the notice of British farmers by Professor Wrightson, in an article contributed to the *Journal of the Royal Agricultural Society* in the year 1874. The system consists in cramming the green food, of whatever description, tightly down into deep and wide trenches that have been dug in the ground, and the wetter the fodder is the better its packing and preservation; when cut out in winter it is found to be a rich brown colour, very palatable to stock, and it is known under the unattractive name of "sour hay." In this way various kinds of green forage may be preserved for winter use. *Dairy Farming.*

# The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MARCH 10, 1880.

MONTH AND DAY	BAROMETR.		TEMPERATURE OF THE AIR.				Hygrometrical Deductions from Glaisher's Tables 6th Edition	WIND	RAINFALL

- March 4—A fine bright day. Partially cloudy. Windy, mild.
- 5.—A fine day, dull and cloudy at times. Windy. Cloudless at night. Quite warm.
- 6.—Dull morning, fine and bright afterwards. Cloudless at night.
- 7.—Very fine till 10 A.M., dull afterwards. Very dark between noon and 2 P.M. Frequent rain.
- 8.—Dull till 11 A.M., then fine till evening; overcast at night. Cool.
- 9.—Dull early part of morning, very fine afterwards. A beautiful day. Cold in morning, warm in afternoon.
- 10.—Overcast till 10 A.M., very fine and bright afterwards. Warm in afternoon. Clear at night.

**LONDON: Barometer.**—During the week ending Saturday, March 6, in the vicinity of London the reading of the barometer at the level of the sea increased from 29.66 inches at the beginning of the week to 29.69 inches by the morning of February 29, decreased to 29.35 inches by the morning of March 3, increased to 30.20 inches by the morning of the 6th, and decreased to 30.08 inches by the end of the week. The mean reading for the week at sea level was 29.72 inches, being 0.26 inch below that of the preceding week, and 0.34 inch below the average.

**Temperature.**—The highest temperatures of the air observed by day varied from 61.4° on March 5 to 50.1° on February 29; the mean value for the week was 54°. The lowest temperatures of the air observed by night varied from 34.4° on March 2 to 48° on the 5th; the mean value for the week was 42.1°. The mean daily range of temperature in the week was 11.1°, the greatest range in the day being 17°, on March 2, and the least 7.1°, on the 3d.

The mean daily temperatures of the air and the departures from their respective averages were as follows:—Feb. 29, 46°.6, + 6°.4; March 1, 45°.6, + 5°.3; 2d, 44°.3, + 3°.9; 3d, 49°.0, + 8°.5; 4th, 48°.6, + 8°.1; 5th, 53°.6, + 13°.1; 6th, 49°.3 + 8°.8. The mean temperature of the air for the week was 48°.1, being 7.7 above the average of sixty years' observations.

The highest readings of a thermometer with blackened bulb in vacuo, placed in the sun's rays, were 110.1° on the 5th, 102.1° on the 4th, and 100.1° both on March 1 and 6; on the 3d the reading did not rise above 72°. The lowest readings of a thermometer on grass, with its bulb exposed to the sky, were 33° on March 2, and 33.1° on the 1st; the mean of the seven lowest readings was 39.1°.

**Wind.**—The direction of the wind was S.W., and its strength strong. The weather during the week was fine, and very mild, but windy; a violent gale prevailing on March 2.

Rain fell on three days, the amount measured was 0.30 inch.

**ENGLAND: Temperature.**—During the week ending Saturday, March 6, the highest temperatures of the air observed by day were above 59° at Blackheath (London), Cambridge, and Norwich, and below 55° at Brighton and Bradford; the mean value for the week from all stations was 57°. The lowest temperatures of the air observed by night were below 34° at Wolverhampton, Nottingham, Sheffield, Liverpool, and Bradford, and above 37° at Truro, Plymouth, Brighton, and Norwich; the general mean from all places was 35°. The extreme range of temperature in the week was above 26° at Blackheath and Cambridge, and below 19° at Plymouth, Bristol, and Brighton; the mean range from all stations was 22°.

The mean of the seven high day temperatures was above 54° at Truro, Blackheath, and Cambridge, and below 51° at Bristol, Bradford, and Leeds; the mean value from all places was 52.1°. The mean of the seven low night temperatures was below 42° at Brighton, Wolverhampton, Nottingham, Sheffield, Hull, Bradford, Leeds, and Sunderland; and above 45.2° at Truro and Plymouth; the mean from all stations was 42.1°.

The mean daily range of temperature in the week was above 12° at Cambridge, Nottingham, Sheffield, and Hull, and below 7.1° at Plymouth and Bristol; the mean daily range from all places was 10.1°.

The mean temperature of the air for the week from all stations was 46.3°, being 5° higher than the value for the corresponding week in 1879. The mean temperature was above 48° at Truro, Plymouth, Blackheath, and Cambridge, and below 45° at Hull and Bradford.

Rain fell on every day in the week at Bradford, and on five or six days at several other places. The heaviest falls were in Yorkshire, and the amounts varied from 1.87 inch at Bradford, 1.68 inch at Sheffield, 1.64 inch at Hull, 1.62 inch at Bristol, and 1.40 inch at Leeds, to 0.30 inch at Blackheath, 0.33 inch at Norwich, and 0.35 inch at Brighton; the average fall over the country was 0.92 inch.

The weather during the week was generally fine, but stormy.

Snow fell at Liverpool on the 2d, but was general in Yorkshire on the 1st and 2d. On the 2d, at Blackstone Edge, the depth of snow was from 5 to 6 inches; and on the hills near Sheffield from 3 to 4 inches.

Lightning was seen at Cambridge on the 4th and 5th.

**SCOTLAND: Temperature.**—During the week ending Saturday, March 6, the highest temperatures of the air observed by day varied from 55° at Dundee to 51.1° at Greenock; the mean value from all places was 53.1°. The lowest temperatures of the air observed by night varied from 31.4° at Greenock to 35.1° at Glasgow; the mean from all stations was 33°. The mean range of temperature in the week from all places was 20.1°.

The mean temperature of the air for the week from all stations was 42.1°, being 1° below the value for the corresponding week in 1879. The mean temperature was the highest at Leith, 44.1°, and the lowest at Greenock, 40.1°.

Rain.—The heaviest falls of rain measured during the week were 2.50 inches at Greenock, and 1.89 inch at Paisley, and the least fall was 0.11 inch at Aberdeen; the average fall over the country was 1.1 inch.

**DUBLIN.**—The highest temperature of the air was 56.1°, the lowest 32°, the range 24.1°, the mean 46.1°; and the fall of rain 1.67 inch.

JAMES GLAISHER, F.R.S.

## Reports of Societies.

**Royal Horticultural: March 9.**—Contrary to general expectation there was a very fair display of spring flowering plants in the large conservatory, but the attendance of visitors was very small. Messrs. William Paul & Son, Waltham Cross, were awarded a Silver Banksian Medal for a splendid display of cut *Camellia* blooms, consisting in all of nine boxes full. Medals of similar value were also accorded to Messrs. Osborn & Son, for a large and attractive group of forced flowering plants; to Mr. Aldous, for a smaller group of decorative flowering and fine-folaged plants; to H. Little, Esq., for a group of well-grown *Primulas*, *Cinerarias*, and *Amaryllis*, including a large and very handsome specimen of *Cyclamen White Model*. To Mr. William Bull, a Silver Banksian Medal was voted for a charming group of *Orchids* and other flowering plants; and Messrs. Barr & Sugden received a similar award for an exceedingly effective group of well-grown *Cyclamens*. Mr. B. S. Williams received a Bronze Banksian Medal for a fine group of *Cyclamens*, and Messrs. Carter & Co. one of the same class for a group of *Cyclamens*. An attractive group of decorative plants also came from Chiswick, including a number of specimens of *Imanophyllum miniatum*, three forced plants of *Wistaria sinensis*, &c.

**SCIENTIFIC COMMITTEE.**—Sir J. D. Hooker, K.C.S.I., in the chair.

**Galvanised Wire and Peach Shoots.**—The Rev. G. Henslow gave an account of the microscopical appearances in the shoot referred to him at the last meeting. The younger tissues were quite dead, but whether death resulted from mechanical pressure, or from some destructive chemical action set up by the galvanised wire, there was no evidence to show. Dr. Masters showed another specimen received from Mr. Hudson, gr., Gunnersbury House, and which had been so tied that no injurious constriction could have taken place, though possibly some amount of friction might have occurred occasionally. The appearances

presented were consistent with the notion that the effects were due to frost.

**Plants Exhibited.**—From Mr. Bull, *Fritillaria oranensis*; from Mr. G. F. Wilson, *Begonia* sp., referred to Kew for name; from Rev. H. Harpur-Crewe, *Galanthus Redoutei*, a remarkably distinct species, with almost globose flowers, and leaves like those of *Scilla amena*; and *Corydalis Kolpakowskyana*, with flowers of pale flesh-colour.

**Effects of the Winter of 1879-80.**—On the suggestion of Mr. Elwes, a sub-committee was appointed to collect evidence as to the effect of the severe frost on vegetation.

**Electric Light.**—Mr. W. T. Thiselton-Dyer proposed the appointment of a sub-committee to investigate certain points of vegetable physiology of interest to cultivators by means of the electric light. There was reason to believe that facilities for the purpose might be obtained at Kew in connection with the Jodrell laboratory.

**FLORAL COMMITTEE.**—Dr. Denny in the chair. Messrs. James Veitch & Sons exhibited the New Bornean *Pothos ceratocaulis*, described at p. 200; a plant of the handsome *Dendrobium crassinode Barberianum* with two splendid spikes of flowers, to which a Cultural Commendation was awarded; a flowering plant of the scarce *Laelia Dormanniana*, and several seedling forms of *Amaryllis*. Cut flowers of *Rhododendron fulgens*, obtained from trees growing in the open air, were shown by Mr. Cox, The Gardens, Redleaf, Penshurst, Kent; and Mr. J. Harris, gr. to Mrs. Vivian, Singleton, Swansea, sent some cut blooms of *Rhododendron barbatum*, also grown in the open air. Mr. Melville sent from Dunrobin cut flowers of several varieties of *Snowdrop*; and Mr. James showed a set of single blooms selected from his this season's batch of seedlings, and which were Highly Commended. Messrs. E. G. Henderson & Son showed flowering plants of several varieties of double-flowered *Primulas*, the best of which as decorative plants being the old Double White and the old Double Purple; while amongst those well worth growing to supply full double flowers for wiring were Miss Eva Fish, a pretty shaded rosy-lilac flower, and Princess of Wales, pure white. Mr. Speed, of Chatsworth, received a vote of thanks for a fine flowering specimen of *Renanthera coccinea*, from 7 to 8 feet high, and bearing two branching spikes of its deep scarlet flowers, and the remains of several previous bloom-spikes. Mr. Harding, gr. to the Marchioness of Huntley, Orton Hall, Peterborough, received a vote of thanks for cut blooms of *Cianthus puniceus*, and the still more beautiful *Cianthus Dampieri*. From Mr. K. Dean, of Ealing, came examples of the pretty bedding *Primrose*, *Ilacina*, also of the fine dark maroon coloured *Primrose auriculiflora*, and a pretty variety named *Cardinal*, of a lighter shade of colour than the former, and having a short pink line in the centre of the margin of each segment. Mr. Rapley, gr. to J. Brand, Esq., Bedford Hill House, Balham, showed a seedling *Cineraria* named *George Brand*, a large bold decorative flower, purplish-crimson in colour. A full rich regal-purple coloured *Cineraria*, named *Intensity*, was also shown by Mr. Cannell. From G. F. Wilson, Esq., came a species of *Begonia* received from New Granada, with a graceful pendulous habit, very small grass-green leaves, and small pink flowers. Mr. Bull also contributed a small group, conspicuous amongst which were *Cattleya Trianae* var. *rosea*, *Odontoglossum Ruckerianum* with one good spike, the Indian *Dendrobium Freemanni*, and a very pretty Algerian species of *Fritillaria* named *oranensis* (see fig. 62). Mr. G. Baker, Combe Cottage, Kingston-on-Thames, showed a very handsome seedling *Amaryllis* named *marginata superba*, with four grand flowers, white, heavily banded with crimson. Messrs. James Carter & Co. exhibited a scarlet-flowered species of *Fuchsia*, received from Mexico, and which has the peculiarity of producing its flowers on the old wood before producing leaves. The same firm also exhibited examples of two new Fern-leaved Chinese *Primulas*, one of which may be considered the nearest approach to a blue *Primula* that has yet been obtained. The colour is a pale shade of porcelain-blue. A prettily fringed Fern-leaved and white-flowered variety was also shown by Mr. B. S. Williams; and Mr. H. Bennett, of Stapleford, exhibited a seedling *Tea Rose* named *Lady Mary Fitzwilliam*, a large, full, double flower, rose-pink in colour, and deliciously scented. Messrs. Paul & Son, Cheshunt, contributed a nice assortment of cut blooms of *Camellias*; and from the Rev. J. G. Nelson, Aldborough Rectory, Norwich, came flowering examples of his new hybrid *Lachenalia*.

#### NEW PLANTS CERTIFICATED.

First-class Certificates were awarded to Messrs. James Veitch & Sons, for *Polystichum tripterion*, a Japanese species with pinnate fronds of a bright green colour, remarkable for their narrow outline, and for the two much enlarged basal pinnae. To Mr. H. Cannell, Swanley, for *Fuchsia penduliflora*, a showy and attractive plant, with the character of *F. corymbiflora* in miniature, but which was generally

believed to be the same as *F. boliviensis*. To Mr. Greenfield, The Priory Gardens, Warwick, for *Cineraria* Mrs. Thomas Lloyd, the finest double-flowered variety that has yet been shown—the almost globular full double flowers measuring  $1\frac{1}{2}$  inch in diameter, and in colour a rich deep shade of purplish-magenta. To Mr. James, Redlees Gardens, Isleworth, for *Cineraria* Master Harold, one of the most perfect single-flowered varieties that even this successful raiser has yet obtained. It is a crimson shade of magenta in colour, with a white ring surrounding a grey disc, and in form, substance, and colour, excepting only the grey disc, is all that the most fastidious florist could desire. To Mr. Wiggins, gr. to H. Little, Esq., Hillingdon Court, Uxbridge, for *Primula sinensis* var. *Meteor*, a rich crimson-scarlet in colour, but scarcely up to first-class form, and as shown certainly not so decorative a plant as *Chiswick Red*. To Mr. King, gr. to J. Simpson, Esq., Wray Park, Reigate, a Second-class Certificate was awarded for a large white-flowered seedling *Abutilon* named *Purity*.

## Variorum.

**THEORY AND PRACTICE.**—Hypothesis is a veritable Scylla, that captivates the imagination, and often sends the visionary to destruction, while practice alone is a hard-hearted Charybdis, that lures the matter-of-fact practical man to folly and expense. Practice must be tempered with theory to utilise advantageously the great forces of Nature, and theory itself must be based on practice, or on facts, to be comprehensive and acceptable. Hence success is the offspring of the marriage of practice and theory. . . . What is theory? It is an explanation of the hidden cause of certain effects that are evident to the senses. It is an effort of the imagination to account for operations which are in themselves invisible and insensible, but which result in facts which are observable and known. Hypothesis is an imaginary explanation of the cause of certain phenomena which remains to be shown probable or proved to be true. Theory is this supposition when it has been shown to be highly probable, and all known facts are in agreement with its truth. . . . The criterion of a good theory is its power of prediction. A false theory has never led to prevision—neither the corpuscular theory of light, nor the fluid theories of heat and electricity, ever led to the prediction of something which eyes had not seen, nor ears heard. The triumphs of prediction in astronomy, sound, light, and heat, are innumerable. *Proce.*

**VITALITY OF SEEDS.**—The greater portion of St. George's Hills, Byfleet, is covered with Scotch Fir. In one particular locality, where the trees have attained large dimensions, it has been the custom to plant from time to time various kinds of shrubs, &c. Now it is rather remarkable that, although there is no natural undergrowth of any kind at this particular place, as soon as the soil is turned over to a certain depth a quantity of Birch seedlings show themselves, thus proving that the soil must be full of seeds of this tree. Within the memory of man no Birch has grown there, but evidently at one time it must have existed in quantity. There is no means of knowing how long these seeds have been lying in the earth; but, as they have become covered with a body of soil thick enough to prevent their germinating, it must have been at some remote period in the history of this country. *J. C. B., in the "Field."*

**A NOTE ON THE WEATHER OF 1880.**—Our forefathers used to

"Divine by the firste daye of the yere and by the Crystmasse daye what it shall falle in the yere folowynge. If it falle on the Sondaye the wynter shall be good and the somer good and drye and plente of wyne. Oxen and sheep shall well weye and multiplye. Olde men and olde women shall deyed, and peas and accord shall be made that yere also.

"The kalendas of Januarye fell on thursdaye whan as theye saye shulde falle plente of all good and peas also. [It did in this present year of grace 1880.]

"All the yere foloweth the dysposycyon of the xii days in Crystmasse. So that the fyrste moneth shall be suche in Wedryng as the fyrste daye of the xii dayes is, the seconde moneth as the seconde daye is, and so forth all folowynge." "*Dives and Pauper*," 1496, 1st Comm. cap. xlvii. xlviii.

*Mackenzie E. C. Walcott, in "Notes and Queries."*

**GIANT GUM TREES.**—One of the most remarkable trees, which was pointed out to me by Mr. T. Kirk, F.L.S., is the *Rata*, a *Metrosideros*, *M. robusta*. This, though a myrtaceous plant, has all the habits of the Indian Figs,\* reproducing them in the closest manner. It starts from a seed dropped in the fork of a tree, and grows downward to reach the ground, then taking root there and gaining strength, chokes the supporting tree and

\* T. Kirk, F.L.S., "On the Habit of the *Rata*, *Metrosideros robusta*," *Trans. New Zealand Inst.*, vol. iv., 1871, p. 26.

entirely destroys it, forming a large trunk by fusion of its many stems. Nevertheless, it occasionally grows originally directly from the soil, and then forms a trunk more regular in form. Another *Metrosideros*, *M. florida*, is a regular climber. *Notes of a Naturalist on the "Challenger,"* by H. N. Moreley.

**CHEAPNESS OF CORN IN THE SIXTEENTH CENTURY.**—Here is a curious and amusing extract from *Pepys' Diary* of January 1, 1668:—"Dined with my Lord Crewe, with whom was Mr. Browne, clerk of the House of Lords, and Mr. John Crewe. . . . Here they did talk much of the present cheapness of corne, even to a miracle; so as their farmers can pay no rent, but do fling up their lands; and would pay in corne; but (which I did observe to my lord and he liked well of) our gentry are grown so ignorant in everything of good husbandry, that they know not how to bestow this corne; which, did they understand but a little trade, they would be able to joyne together, and know what markets there are abroad, and send it thither, and thereby ease their tenants and be able to pay themselves." *The Farmer.*

## Obituary.

WE regret to record the death, on the 26th ult., of Mr. WILLIAM HALLIDAY, for many years assistant to Mr. Marnock, in which capacity he made a host of friends. He commenced his career in the Royal Botanic Society's Garden, Regent's Park, and subsequently entered the service of Messrs. James Veitch & Sons, with whom he stayed for several years, and then became assistant to Mr. Marnock, with whom he remained until that gentleman retired a year or two ago. Mr. Halliday then commenced business as a landscape gardener at Sheffield, with the prospect of a successful career before him. He was, however, attacked by acute bronchitis, and died on February 26, at the comparatively early age of forty-five. He was buried on March 2, at West Brompton, several of his oldest friends attending to pay the last mark of respect that could be shown to a very worthy man.

—Died, on the 9th inst., at 15, Brownswood Park, Stoke Newington, SARAH ELIZABETH, the beloved wife of Shirley Hibberd, in her 57th year.

## Answers to Correspondents.

**ARTIFICIAL MANURES:** *J. Marshall.* You cannot do better than continue to use what you have found very good.

**BEGONIA:** *R. Keen.* The *Begonia* is a splendid thing in its way, whatever its habit. Of this latter we can form no idea, as you do not send a leaf nor any indication of its parentage. The flowers, clustered in great bunches at the ends of a thrice-branched dichotomous cyme, are large and of a brilliant vermilion-red.

**BRAZILIAN PLANTS:** *Young Beginner.* There are many fine Brazilian Orchids and various bulbs, such as *Hippeastrum*, well worth growing. There is no reason why these should not flourish in your two vineries, provided you can transfer them to other suitable pits or houses when the Vines require to be kept dry and cool.

**CALCEOLARIAS:** *C. Richards.* Your last year's seedlings ought to be "inclined" to blossom now.

**CAULIFLOWER PLANTS:** *R. P. H.* We can offer no further suggestion. The leaves had all the appearance of being eaten by thrips. What had been previously growing in the frame into which they were pricked out? Was the soil used fresh, or had some other insect-bearing crop been grown in it?

**LEATHER PARINGS:** *H.* These, like horn-shavings, consisting of animal matter, make a useful manure. We cannot tell you the price.

**NAMES OF PLANTS:** *E. C. M.* 7, *Pleopeltis pustulata*; 8, *Asplenium marimum*; 9, *Cyrtomium caroytoidum*; 10, *Niphobolus Lingua*; 11, *Lastrea quinqueangulare*; 12, *Candollea cuneiformis*; 13, *Coronilla Emerus*.—*H. M. E.* The Cape Pond-weed (*Aponogon distachyon*). It must have been thrown out of some garden pond, as it is very unlikely it would have grown in a Cornish salt marsh.—*R. F.* *Rhododendron fulgens*.—*Mrs. C. Maynard.* 1, *Smilax aspera*; 2, *Quercus flex*; 3, indeterminate; 4, *Cistus* sp., no flowers; 5, *Euphorbia* sp., no flowers; 6, *Thymelea hirsuta*.—*H. A. C.* 4, *Columnnea erythrophæa* (not *C. hirsuta*, as inadvertently printed last week).—*F. R. Smith.* *Cypripedium barbatum*—very different from *Maulé*, which is a variety of *C. insigne*.—*R. S. H.* 2, *Ilex opaca*. The *Pinus* next week.

**NEW ZEALAND:** *A Young Gardener.*—We know of no reason why you should not do well, if you have a fair knowledge of your business, and go out with a determination to succeed. At first you would probably have to accept what work you could get, until you learn your way about.

**PRIMULAS:** *J. Tomkins.* They are all three very fine sorts. The carmine-crimson is a bright and effective

sort—bold, and well fimbriated; the purple has a bright magenta tint, and contrasts finely with the crimson; these are from 1½ to 2 inches across. The blush flower with a large yellow eye is particularly striking on account of its size, being nearly 2½ inches in diameter.—*A. M.* Your "long-leaved" form is what is called the Fern-leaved Chinese Primrose. This form originated in a sport from seed at least a quarter of a century ago, and there are now white and red-flowered varieties, both single and double, having this distinct and peculiar type of foliage.

**TEA ROSE:** *H. Bennett.* The flower of Hon. George Bancroft was a little gone off when it came to hand, but enough remained to show it to be a most desirable dark purplish-tinted variety.

**VIOLA ARGENTIFLORA:** *G. Lee.* Much the finest single white Violet we have yet seen, and very fragrant.

**WATERING VINE BORDER:** *Young Gardener.* No; the warm water is certainly preferable to cold, as it would not chill the roots. Much, however, would depend on the season of the year and the stage of growth of the Vines.

**WINDOW FLOWER BOXES:** *J. A. E.* We think your best plan would be to look into Covent Garden, and there you will see the flowers that can be easily procured, and suit your own taste as to the kinds; or contract with some one who undertakes furnishing of this sort. The best things in season of this particular class of plants are sure to be found in the market.

\* \* \* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editors," and not to any member of the staff personally. The Editors would also be obliged by such communications being sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editors to see. *Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editors.*

FOREIGN SUBSCRIBERS sending Post-office Orders are requested to make them payable at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

**CATALOGUES RECEIVED:**—Ellwanger & Barry (Mount Hope Nurseries, Rochester, New York). Descriptive Catalogue of Fruits, and Descriptive Priced List of Strawberries.—Harrison & Sons, Leicester. Price List of Choice Seeds for the Farm.—Max Deegen, Jun. (Kostritz, Thuringia). Catalogue of Dahlias.

**COMMUNICATIONS RECEIVED:**—A. B.—H. C.—W. H. D.—J. V. & Sons.—Sir T. L.—T. N. S.—P. Fry.—J. C. & Co.—T. B.—C. F. B.—J. E.—W. M. G.—G. F.—A. H.—C. L.—W. G. S.—J. E. H.—D. N.—E. R. C.—E. W. B.—M.—N. W.—J. K.—J. B.—A. T. S. (as soon as the pressure on our space will permit).—C. S. & Co.—G. T. A.—A. M.—J. E. T. A.—C. H. F.

**Markets.**

**COVENT GARDEN, March 11.**

Business is still quiet, with a good demand for well-kept Grapes. Outdoor vegetables have experienced a great decrease in value. *James Webber, Wholesale Apple Market.*

**FRUIT.**

Apples, ½-sieve .. 2 0-6 0	Oranges, per 100 .. 6 0-12 0

**SEEDS.**

LONDON: *March 10.*—Messrs. John Shaw & Sons, of 37, Mark Lane, state that the consumptive demand for sowing having now begun in earnest, a daily increasing activity is seen on the seed market. With regard to values a fair amount of steadiness is apparent all round. Some very handsome new Canadian red Clover is now obtainable on Mark Lane at exceedingly moderate prices. The imports of Clover and grass seeds into the United Kingdom for the past month amounted to £225,995, against £162,317 for the corresponding month of last year. There is more inquiry for Italian Rye-grass. Spring Tares are rather scarce, and being in good request realise more money. White Dutch runner Beans are now unusually cheap. Very moderate quotations also rule for Haricots, Lentils, and white boiling Peas. There is no change in either Canary, Millet, or Hemp seed. The trade for feeding Linseed is slow.

**CORN.**

At Mark Lane on Monday no change was quoted in the value of Wheat, but the trade was very slow, and any pressure to sell was accompanied with a reduction. Barley found but few buyers, and rates were with difficulty supported. Malt was quiet and without alteration in price. Oats moved off slowly, and except for the best corn prices ruled in buyers' favour. Maize was dull, and in some instances rather easier in price. Beans and Peas were taken off to a limited extent on former terms. Flour met with a poor enquiry, and quotations had a drooping tendency.—Trade for Wheat on Wednesday was exceedingly quiet; the tone was dull, with a tendency to lower prices. Prime malting Barley was scarce and quite as dear as on Monday, but for the other kinds the trade was quiet. Oats, Beans, and Peas were steady in price, but the flour trade was decidedly quiet.—Average prices of corn for the week ending March 6:—Wheat, 44s. 7d.; Barley, 34s. 2d.; Oats, 22s. 4d. For the corresponding period last year:—Wheat, 39s. 1d.; Barley, 34s. 4d.; Oats, 20s. 5d.

**CATTLE.**

At Copenhagen Fields on Monday trade was active for choicest kinds of beasts, otherwise it was slow, and prices on the average were no better, with a few lots left unsold. Trade in sheep was dull, consequently it was difficult to realise the previous Monday's quotations, except for very best qualities. Good calves were scarce and dear. Quotations:—Beasts, 4s. 4d. to 5s., and 5s. 4d. to 5s. 10d.; calves, 5s. to 6s. 6d.; sheep, 5s. to 5s. 6d., and 6s. to 6s. 10d.; pigs, 3s. 6d. to 5s.—Thursday's cattle trade was inactive and without feature. Supplies of beasts and sheep were about the average for a Thursday. Throughout the demand was restricted to Monday's prices. Calves were quiet and unaltered.

**HAY.**

From Tuesday's Whitechapel Market report we learn that there was a small supply and a steady sale at the annexed quotations:—Prime Clover, 100s. to 130s.; inferior, 60s. to 95s.; prime meadow hay, 80s. to 100s.; inferior, 50s. to 70s.; and straw, 30s. to 38s. per load.—On Thursday there was a moderate supply of fodder on sale. The trade was good for best sorts, prices for which were firm, lower sorts being neglected.—Cumberland Market quotations:—Superior meadow hay, 100s. to 110s.; inferior, 40s. to 75s.; superior Clover, 120s. to 132s.; inferior, 84s. to 100s.; and straw, 36s. to 40s. per load.

**POTATOS.**

The Borough and Spitalfields Markets reports state that the trade has been steady. Supplies are only moderate, and sound Potatos are firm in price. Scotch Regents, 140s. to 160s.; Champions, 180s.; Lincoln, 180s.; Victorias, 160s. to 180s. per ton; German reds, 6s. 6d. to 8s.; Dutch rocks, 5s. 6d. per bag.—During last week 155,000 bags were received at London from Hamburg, while the arrivals from other parts of the Continent were on the same liberal scale.

**Government Stock.**—On Monday the closing price of Consols for delivery was 97½ to 97½, and for the account 98 to 98½. Tuesday's figures were, for delivery, 97½ to 97½, and 97½ to 97½ for the account. The closing prices of Wednesday were, for delivery, 97½ to 97½, and 97½ to 98½ for the account. The final figures posted on Thursday were 97½ to 98 for delivery, and 98 to 98½ for the account.

*The Manufacturers of this valuable Manure have hitherto thought it best not to publish Testimonials, as they have particularly wished that no exaggerated statements should appear respecting it. They consider, however, that the opinion of the well-known Florists, Messrs. J. & J. Hayes, of Edmonton—than whom there are no better Plant Growers in England—will be considered of especial value:—*

"Dear Sirs,

"We have been using Clay's Fertiliser largely for some years, and are pleased to say that we consider it by far the best Manure we have ever tried.

"J. & J. HAYES."

PARHAM'S PATENT SYSTEM of GLAZING WITHOUT PUTTY.

With Wrought-iron Channelled Rafters, Continuous Lapped Glass, and Rainproof Ventilators under Glass Super Roof.

Both systems avoid the heavy expense of re-puttying and breakage of glass, and effect a great saving in cost of re-painting and repairs, combined with absolute freedom from drip.

The sole manufacture of both the above systems is carried on by

**WILLIAM PARHAM,**  
Horticultural Builder and Hot-water Engineer,  
NORTHGATE WORKS, BATH;  
AND  
28o, Oxford Street, London, W.  
(Who has purchased the Business of the late Firm of CRANSTON AND LUCK, Birmingham).  
Specimens of both Systems on view at either address.

Illustrated Catalogues free.

"Bank Chambers, Norwich, October 24, 1879.

"T. W. Helliwell, Esq., Brighouse.—Sir,—I went yesterday and examined the Glass Roof Glazed by you, under my directions, at Sandringham, for His Royal Highness the Prince of Wales, and found it perfectly satisfactory in all respects. The appearance is vastly superior to the old system of wood and putty, and I shall be glad to recommend it whenever I can.—Believe me, yours faithfully.

"C. SMEDLEY BECK, Architect."

**KINAHAN'S LL WHISKY.**  
 Pure, Mild and Mellow, Delicious and Most Wholesome. Universally recommended by the Profession. The Cream of Old Irish Whiskies.  
**KINAHAN'S LL WHISKY.**  
 Dr. Hassall says—"Soft and Mellow, Pure, well Matured, and of very excellent quality."  
**KINAHAN'S LL WHISKY.**  
 Gold Medal, Paris Exhibition, 1878; Dublin Exhibition, 1865, the Gold Medal.—20, Great Titchfield Street, London, W.

By a thorough knowledge of the natural laws which govern the operation of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame.—*Cecil Service Gazette.*

**JAMES EPPS AND CO., HOMEOPATHIC CHEMISTS.**

**"OLD DR. JACOB TOWNSEND'S" SARSAPARILLA. THE BLOOD PURIFIER.**

This extraordinary Medicine has a singular influence upon the blood, which it enriches and purifies. It removes all pimples and blotches, purifies the system, and acts like a charm. As a sustaining and purifying tonic it is invaluable, and highly recommended in long-standing cases of indigestion, nervousness, coughs, colds, scrofula, gout, dropsy, and wasting of flesh. Sold by all druggists. Caution.—Get the red and blue wrapper, with the Doctor's head in the centre. No other genuine. In bottles, 2s 6d., 4s 6d., and 11s.—137, Fleet Street, E. C.

**DINNEFORD'S MAGNESIA.**  
 The Medical Profession for over Forty Years have approved of this pure solution as the Best Remedy for

**ACIDITY OF THE STOMACH, HEARTBURN, HEADACHE, GOUT, AND INDIGESTION,**  
 and as the safest Aperient for Delicate Constitutions, Ladies, Children, and Infants.

**DINNEFORD'S MAGNESIA.**  
 No Medicine for the Cure of Asthma, Consumption, Coughs and Bronchitis was ever attended with such speedy and unflinching success as

**DR. LOCOCK'S PULMONIC WAFERS.**  
 In every periodical may be seen testimonials of their wonderful efficacy. Nothing else gives such a sound, refreshing night's rest. In Rheumatic and Nervous Pains they act like a charm. They taste pleasantly. Sold at 1s. 1/2d. and 2s. 9d. per box.

**HOLLOWAY'S PILLS AND OINTMENT.**—Limb and Life.—Not many years ago some Ulcerations and Diseases of the Joints placed in peril the affected limb, whose loss was recommended to spare the risk of life—now the discovery of these noble remedies has made the cure of the worst maladies no longer a matter of doubt. Holloway's treatment preserves the condemned limb, and in its course of cure improves the general health and vigour of the frame. Holloway's Ointment and Pills heal all Sores and Ulcerations, and extirpate Scrofulous Sores. Ulcers, Bad Legs, Scrofulous Discharges, Swollen or Gathered Glands, Contracted Sinews, Enlarged Joints, Rheumatic and Gouty Concretions are readily remediable by the proper and persevering application of these cooling, healing, and purifying preparations, which are as powerful as they are harmless.

# GREEN'S PATENT NOISELESS LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1880.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, H.R.H. the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Upwards of 95,000 of these Machines have been Sold since they were first introduced in the year 1856, And Hundreds of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are the advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either long or short Grass, wet or dry.

## Single-handed Lawn Mower.

To cut 6 inches ... ..	Price	£1 15 0
Can be worked by a Lady.		
To cut 8 inches ... ..	"	2 10 0
Can be worked by a Lady.

Can be worked by a strong Youth.		
To cut 12 inches ... ..	"	4 10 0
Can be worked by a Man.		
To cut 14 inches ... ..	"	5 10 0
Can be worked by a Man.		

## Double-handed Lawn Mower.

To cut 16 inches ... ..	Price	£6 10 0
This can be worked by One Man on an even lawn.		
To cut 18 inches ... ..	"	7 10 0
By a Man and Boy.		
To cut 20 inches ... ..	"	8 0 0
By a Man and Boy.		
*To cut 22 inches ... ..	"	8 10 0
* If made stronger, suitable for Donkey, 30s. extra.		
*To cut 24 inches ... ..	"	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.		

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

### DONKEY and PONY MACHINES.

To cut 26 inches ... ..	£14 0 0
To cut 28 inches ... ..	16 0 0
To cut 30 inches ... ..	18 0 0
Leather Boots for Donkey ... ..	1 0 0
Leather Boots for Pony ... ..	1 4 0

### HORSE MACHINES.

To cut 30 inches ... ..	£22 0 0
To cut 36 inches ... ..	26 0 0
To cut 42 inches ... ..	30 0 0
To cut 48 inches ... ..	34 0 0
Leather Boots for Horse ... ..	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machine.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 53 and 55, Blackfriars Road, where purchasers can select from upwards of 500 Machines of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

# GREEN'S PATENT ROLLERS

FOR LAWNS, DRIVES, BOWLING GREENS, CRICKET FIELDS, AND GRAVEL PATHS,

SUITABLE FOR HAND OR HORSE POWER.

These Rollers are made in Two Parts, and are free in revolving on the axis, which affords greater facility for turning. The outer edges are rounded off, or turned inwards, so that the unsightly marks left by other Rollers are avoided.

Cheltenham.

HIGHLY IMPORTANT SALE of probably the grandest Collection of STOVE and GREENHOUSE SPECIMEN EXHIBITION PLANTS ever submitted to public competition.

MESSRS. PROTHEROE AND MORRIS will SELL BY AUCTION, without the slightest reserve, in the large Pittville Pump Room, Cheltenham, Gloucestershire, on WEDNESDAY, March 27, and THURSDAY, April 1, at 11 for 12 o'clock precisely each day, by order of Ed. Pilgrim, Esq., who is giving up exhibiting the whole of the unrivalled Collection of SPECIMEN EXHIBITION PLANTS, which have been exhibited with unprecedented success at the leading shows throughout the country. Amongst the Stove and Greenhouse specimens may be mentioned twelve remarkably fine Anthurium Scherzerianum, large-spined varieties, a matchless plant of Cordyline indivisa with thirty-six leaves, several magnificent Crotons, unsurpassed for rich colouring and perfect training; fifteen grand Ixoras, including a noble plant of Pilgrim, and nine smaller plants (being the entire stock of this splendid novelty). Also an extensive assortment of Specimen Cape Heaths and Indian Azaleas, containing a great number of matchless plants, and consisting of the choicest Exhibition varieties; also fine examples of Lapageria alba and rosea, Allamandas, Dipladenias, Bougainvilleas, &c.; also a large assemblage of remarkably handsome Palms and Cycads, many of which are the grandest examples in Europe; several large Exotic Ferns, embracing twenty unapproachable Specimen Gleichenias, also several fine Todeas, Cyatheas, Asplondias, together with a few Established Orchids; likewise Two newly-built GREENHOUSES, HOT-WATER PIPING, STOCK BRICKWORK, and Two well-made Exhibition YANS, with all modern improvements, made to travel by road or rail.

The stock may be viewed any day prior to the Sale. Catalogues may be had (price 6d. each, returnable to purchasers) of Mr. HAMLET, Head Gardener, Fern Lawn, Pittville, Cheltenham; and of the Auctioneers, Estate Agents, and Valuers, 98, Gracechurch Street, London, E.C., and Leytonstone, E.

Clifton Nursery, Clifton Villas, Warwick Road, Paddington, W.

PARIS MARKET: NEW GARDEN

TURNIP—A fine new Continental variety, of rapid growth and delicious flavour. Quite distinct from all other Turnips. It is exceedingly sweet and juicy, and should be found in every Garden. Per oz. 1s., post-free.—DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

DANIELS' DEFIANCE CABBAGE.—The finest variety in cultivation, grows rapidly to a large size, and is of the most delicious marrow flavour. Has been awarded First Prizes wherever exhibited. Per packet 1s. 6d.; per oz. 3s. 6d., post-free.—DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

DUKE OF EDINBURGH CUCUMBER

(Daniels).—Beautiful white-spined variety, pronounced by all competent judges to be the finest Cucumber in cultivation. Fine robust constitution and habit, fruit growing rapidly to the length of 30 to 36 inches, being at the same time of the most beautiful proportions, and of a fine rich green colour, which it retains to the last. First-class for Exhibition. Per packet, 1s. 6d., and 2s. 6d., post-free. Beautifully illustrated CATALOGUE free to all customers on application.—DANIELS BROS., Royal Norfolk Seed Establishment, Norwich.

LEICESTER RED CELERY has again

proved itself to be the hardest, sweetest, most solid, and best Celery this unfavourable season; when most kinds have been soft and watery this has been good in every way. Those wishing to obtain the true article should have it in printed packets, price 1s.; post-free on receipt of 13 stamps. BROCCOLI, Harrison's new Dwarf Hardy; a late valuable kind, 1s. per packet. SAVOY, Harrison's King Coffee Garden, 1s. per packet. TURNIP, Harrison's Exhibition; a perfect round white variety, from 6d. per packet. CARROT, Harrison's Early Market, 6d. per packet.

HARRISON'S "LEICESTER SEEDS," of

the choicest quality, are supplied in collections of 21s. and upwards, sent carriage free. Trade Prices and full particulars on application to HARRISON AND SONS, Seed Growers, Leicester.

THE BEST THE LAWSON SEED AND NURSERY COMPANY (Limited)

respectfully invite attention to their Extensive Stocks of FOREST, ORNAMENTAL, and FRUIT TREES, Dwarf and Standard ROSES, Vines, &c., all in splendid condition. Where personal inspection is not convenient, special offers will be made, and CATALOGUES sent on request.

Special Railway Tickets to and from the New Nurseries, Granton Road, may be had gratis, at 1, George IV. Bridge, Edinburgh.

MAGNUM BONUM POTATOS.—A

splendid sample of the above, grown from Seed, direct from the raiser (Mr. Clarke), price 7s. 6d. per bushel of 56 lb., free on rail, sacks included. Also about 10,000 strong HAZEL, at 15s. per 1000.

H. T. BATH, Seedsman, &c., 80, High Street, Lympington.

TREES FOR AVENUE, PARK, OR STREET PLANTING.

- ACER DASYCARPUM, 14 to 16 feet, girtling 5 to 7 inches.
CHESTNUT, Horse, 12 to 14 feet, girtling 5 to 7 inches.
" Horse, 14 to 16 feet, girtling 8 to 10 inches.
" Horse, Scarlet, 10 to 14 feet, girtling 6 to 8 inches.
LIMES, 14, 15, 16, 18, and 20 feet, girtling 6 to 10 inches.
PLANES, Occidental, 10 to 12 feet, girtling 4 to 5 inches.
" Occidental, 12 to 14 feet, girtling 5 to 6 inches.
A few hundred splendid PLANES, 16 to 18 feet, girtling 8 to 10 inches.
POPULUS CANADENSIS NOVA, 12 to 14 feet, girtling 6 inches.
MAPLES, Norway, 12 to 16 feet.
BEECH, Purple, 10 to 12 feet.
OAKS, Scarlet, 10 to 12 feet.
CHESTNUTS, Spanish, 10 to 12 feet.
SYCAMORE, 12 to 15 feet.
They have straight stout clean stems, and handsomely furnished well balanced heads, and from frequently transplanting are splendidly rooted. They are without doubt the finest stock of Avenue Trees to be met with in any Nursery in Europe. The girth of the stems is taken at 4 feet from the ground, and not at the base, which is often deceptive. ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

New Catalogue for 1880.

WM. CLIBRAN AND SON, The Oldfield Nurseries, Altrincham, Cheshire, will have great pleasure in sending their DESCRIPTIVE PRICED LIST upon application. Their stock of Florists' Flowers, Bedding and Soft-wooded Plants generally, is surpassed by none either in extent or quality, all the newest and best varieties being constantly added to the various classes, and the greatest care is taken to keep the varieties true to name. Another great advantage to purchasers is that none of the Plants offered are taken from a warm propagating-house and sent off immediately, but are all carefully hardened, and most of them potted off singly, and are thereby fitted for transit by post or rail without the slightest injury. A great proportion of the under-mentioned are autumn-struck plants, and can be had in pots if required, and all in a variety of sorts and colours, all good for exhibition or home decoration:—

Large table listing various plants and seeds with prices, including Abutilons, Achimenes, Ageratum, Begonias, Calceolarias, Clematis, Coleus, Dactylis, Dahlias, Delphiniums, Epiphyllum, Fuchsias, Geraniums, Gladioli, Gloxinias, Hollyhocks, Helianthemums, Lobelias, Pelargoniums, Pinks, Primroses, Pyrethrums, Roses, Saxifrages, Sedums, Stoves, Succulents, Tropaeolums, Verbenas, Vines, and various other plants.
